target gene, herein designated TARGET GENE. FLJ35487 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ35487, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ35487 BINDING SITE, designated SEQ ID:18431, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24788] Another function of GAM148 is therefore inhibition of FLJ35487 (Accession NP_776181.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ35487.

[24789] FLJ40584 (Accession XP_069189.2) is another GAM148 target gene, herein designated TARGET GENE. FLJ40584 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ40584, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ40584 BINDING SITE, designated SEQ ID:10385, to the nucleotide sequence of GAM148 RNA, herein designated

GAM RNA, also designated SEQ ID:280.

[24790] Another function of GAM148 is therefore inhibition of FLJ40584 (Accession XP_069189.2) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ40584.

[24791] Glutamic pyruvate transaminase (alanine aminotransferase) 2 (GPT2, Accession NP_597700.1) is another GAM148 target gene, herein designated TARGET GENE. GPT2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPT2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPT2 BINDING SITE, designated SEQ ID:580, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24792] Another function of GAM148 is therefore inhibition of Glutamic pyruvate transaminase (alanine aminotransferase) 2 (GPT2, Accession NP_597700.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPT2.

[24793] GRTP1 (Accession NP_078995.1) is another GAM148 target gene, herein designated TARGET GENE. GRTP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GRTP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GRTP1 BINDING SITE, designated SEQ ID:6509, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24794] Another function of GAM148 is therefore inhibition of GRTP1 (Accession NP_078995.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRTP1.

[24795] Huntingtin interacting protein 2 (HIP2, Accession NP_005330.1) is another GAM148 target gene, herein designated TARGET GENE. HIP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HIP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HIP2 BINDING SITE, designated SEQ ID:8300, to the nucleotide sequence of GAM148 RNA,

herein designated GAM RNA, also designated SEQ ID:280.

[24796] Another function of GAM148 is therefore inhibition of Huntingtin interacting protein 2 (HIP2, Accession NP_005330.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIP2.

[24797] Homeo box a7 (HOXA7, Accession NP_008827.2) is another GAM148 target gene, herein designated TARGET GENE. HOXA7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HOXA7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HOXA7 BINDING SITE, designated SEQ ID:6135, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24798] Another function of GAM148 is therefore inhibition of Homeo box a7 (HOXA7, Accession NP_008827.2), a gene which provides cells with specific positional identities on the anterior- posterior axis. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXA7.

[24799] The function of HOXA7 has been established by previous

studies. The homeotic genes, whose products serve as determinants of embryonic cell fate, are expressed in a series of different but partially overlapping domains that extend along the anterior- posterior (A- P) axis of the embryo. The Hox genes share a 180- bp homeo box, which encodes a 60- amino acid homeodomain that binds specifically to DNA. There are 4 Hox gene clusters: HOXA (formerly HOX1) on chromosome 7, HOXB (formerly HOX2) on chromosome 17, HOXC (formerly HOX3) on chromosome 12, and HOXD (formerly HOX4) on chromosome 2. By sequence comparison, the genes of each cluster are assigned to 1 of 13 groups. The order of the HOX genes along the chromosome reflects where they are expressed along the body axis. This principle is followed in homeo box gene nomenclature. For a review of homeo box gene nomenclature, see Scott (1992). The homeo box is a 180-bp DNA sequence conserved in Drosophila homeotic genes which regulate early development (review by Gehring, 1985). These DNA sequences are present in open reading frames and have been identified in Drosophila and Xenopus embryos. They share structural features with genes encoding some DNA- binding proteins. Homologous homeo box sequences have been detected in species

ranging from insects and annelids to vertebrates. The high degree of sequence conservation (70 to 90%) suggests a common role in embryonic development. Schughart et al. (1989) pointed to evidence of duplication of large genomic regions during evolution of the mouse homeo box genes. The findings were considered consistent with the hypothesis of Ohno (1970) that during vertebrate evolution duplications of the entire genome occurred. Such are likely to be less deleterious than duplications of individual chromosomes. Ferguson- Smith et al. (1989) showed that the sequence of the HOX1 gene has 100% identity to the deduced amino acid sequence of the mouse HOX1.4 homeo box. They detected no RFLPs with the 14- kD clone, which was devoid of any moderately repetitive DNA sequences. This implied an inability of this region to tolerate change in sequence, consistent with a function highly conserved throughout evolution

[24800] Animal model experiments lend further support to the function of HOXA7. As reviewed by Gaunt and Singh (1990), in both the mouse and Drosophila, Antennapedia-like homeo box- containing genes (homeogenes) display a strict correspondence between the order of genes (3-prime to 5- prime) along the chromosome and the order

of their expression domains (anterior to posterior) in the developing embryo. Gaunt and Singh (1990) suggested that this and other points of similarity indicate that the 2 species use a common mechanism of chromosomal imprinting in order to retain cellular memory of homeogene expression patterns throughout embryonic development. The 'open for transcription' model suggests that imprinting is a matter of open and closed chromatin, the molecular nature of which is not clear. It is possible that a clue to the mechanism of memory used within the homeogene complex, at least in Drosophila, is provided by the Drosophila mutant 'Polycomb' (Pc). The product of the Pc gene, which presumably has a homolog in man, appears to act as a repressor of 'posterior' genes in anterior segments. Thus, it may be involved in restricting the state of 'openness' of the homeotic gene complex.

[24801] It is appreciated that the abovementioned animal model for HOXA7 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[24802] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24803] Schughart, K.; Kappen, C.; Ruddle, F. H. : Duplication of large genomic regions during the evolution of vertebrate homeobox genes. Proc. Nat. Acad. Sci. 86: 7067- 7071, 1989. ; and

[24804] Scott, M. P. : Vertebrate homeobox gene nomenclature. (Letter) Cell 71: 551- 553, 1992.

[24805] Further studies establishing the function and utilities of HOXA7 are found in John Hopkins OMIM database record ID 142950, and in cited publications listed in Table 5, which are hereby incorporated by reference.Histamine receptor h3 (HRH3, Accession NP_009163.1) is another GAM148 target gene, herein designated TARGET GENE. HRH3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HRH3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HRH3 BINDING SITE, designated SEQ ID:6908, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24806] Another function of GAM148 is therefore inhibition of Histamine receptor h3 (HRH3, Accession NP_009163.1) . Accordingly, utilities of GAM148 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with HRH3.

[24807] Insulin-like growth factor 2 (somatomedin a) (IGF2, Accession NP_000603.1) is another GAM148 target gene, herein designated TARGET GENE. IGF2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by IGF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IGF2 BINDING SITE, designated SEQ ID:12962, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24808] Another function of GAM148 is therefore inhibition of Insulin-like growth factor 2 (somatomedin a) (IGF2, Accession NP_000603.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGF2.

[24809] Integrin, alpha l (antigen cd11a (p180), lymphocyte function-associated antigen 1; alpha polypeptide) (ITGAL, Accession NP_002200.1) is another GAM148 target gene, herein designated TARGET GENE. ITGAL BINDING SITE is a target binding site found in the 3` untranslated region of

mRNA encoded by ITGAL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ITGAL BINDING SITE, designated SEQ ID:15602, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24810] Another function of GAM148 is therefore inhibition of Integrin, alpha l (antigen cd11a (p180), lymphocyte function-associated antigen 1; alpha polypeptide) (ITGAL, Accession NP_002200.1), a gene which s a receptor for icam1, icam2, icam3 and icam4. it is involved in a variety of immune phenomena including leukocyte- endothelial cell interaction, cytotoxic t- cell mediated killing, and antibody dependent killing by granulocytes and monocytes. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGAL.

[24811] The function of ITGAL has been established by previous studies. See 120980 and 151510. Lymphocyte function-associated antigen- 1 (LFA- 1) shares a beta subunit (see OMIM Ref. No. 116920) with other members of a family of leukocyte surface membrane antigens but has a unique

alpha subunit (Sanchez- Madrid et al., 1983). LFA- 1 is expressed on lymphocytes and phagocytic cells. The LFA- 1 molecule is involved in the adhesion of cytotoxic T cells to their target cells. Patients with LFA- 1 immunodeficiency disease (see OMIM Ref. No. 116920) have recurrent life- threatening infections, show deficiency of the beta chain of all 3 molecules, LFA- 1, Mac- 1 (macrophage antigen- 1), and p150,95, and display profound defects in adhesion- dependent granulocyte, monocyte, and B- and T- lymphocyte functions. The alpha subunits were designated by Marlin et al. (1986) as alpha- L for LFA- 1, alpha- M for Mac- 1, and alpha- X for p150,95. Lu and Cyster (2002) studied the mechanisms that control localization of marginal zone B cells. They demonstrated that marginal zone B cells express elevated levels of the integrins LFA- 1 and alpha- 4- beta- 1 (see OMIM Ref. No. 192975 and 135630) and that the marginal zone B cells bind to the ligands ICAM1 (OMIM Ref. No. 147840) and VCAM1 (OMIM Ref. No. 192225). These ligands are expressed within the marginal zone in a lymphotoxin- dependent manner. Combined inhibition of LFA- 1 and alpha- 4- beta- 1 causes a rapid and selective release of B cells from the marginal zone. Furthermore, lipopolysac-

charide- triggered marginal zone B cell relocalization involves downregulation of integrin- mediated adhesion. Lu and Cyster (2002) concluded that their studies identified key requirements for marginal zone B cell localization and established a role for integrins in peripheral lymphoid tissue compartmentalization

[24812]

[24816] Further studies establishing the function and utilities of ITGAL are found in John Hopkins OMIM database record ID 153370, and in cited publications listed in Table 5, which are hereby incorporated by reference.KIAA0062 (Accession XP_046677.3) is another GAM148 target gene, herein designated TARGET GENE. KIAA0062 BINDING SITE

is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0062, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0062 BINDING SITE, designated SEQ ID:17664, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24817] Another function of GAM148 is therefore inhibition of KIAA0062 (Accession XP_046677.3) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0062.

[24818] KIAA0101 (Accession NP_055551.1) is another GAM148 target gene, herein designated TARGET GENE. KIAA0101 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0101, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0101 BINDING SITE, designated SEQ ID:11332, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24819] Another function of GAM148 is therefore inhibition of KIAA0101 (Accession NP_055551.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0101.

[24820] KIAA0522 (Accession XP_291345.1) is another GAM148 target gene, herein designated TARGET GENE. KIAA0522 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0522, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0522 BINDING SITE, designated SEQ ID:9466, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24821] Another function of GAM148 is therefore inhibition of KIAA0522 (Accession XP_291345.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0522.

[24822] KIAA1458 (Accession XP_044434.1) is another GAM148 target gene, herein designated TARGET GENE. KIAA1458 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by KIAA1458, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1458 BINDING SITE, designated SEQ ID:9176, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24823] Another function of GAM148 is therefore inhibition of KIAA1458 (Accession XP_044434.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1458.

[24824] KIAA1656 (Accession XP_038022.1) is another GAM148 target gene, herein designated TARGET GENE. KIAA1656 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1656, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1656 BINDING SITE, designated SEQ ID:7823, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24825] Another function of GAM148 is therefore inhibition of

KIAA1656 (Accession XP_038022.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1656.

[24826] KIAA1909 (Accession XP_291137.1) is another GAM148 target gene, herein designated TARGET GENE. KIAA1909 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1909, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1909 BINDING SITE, designated SEQ ID:6342, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24827] Another function of GAM148 is therefore inhibition of KIAA1909 (Accession XP_291137.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1909.

[24828] Kinesin family member 5a (KIF5A, Accession NP_004975.1) is another GAM148 target gene, herein designated TARGET GENE. KIF5A BINDING SITE is a target binding site found in the 5` untranslated region of mRNA

encoded by KIF5A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIF5A BINDING SITE, designated SEQ ID:5352, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24829] Another function of GAM148 is therefore inhibition of Kinesin family member 5a (KIF5A, Accession NP_004975.1), a gene which is a microtubule- associated force- producing protein that may play a role in organelle transport. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIF5A.

[24830] The function of KIF5A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.LCX (Accession XP_167612.2) is another GAM148 target gene, herein designated TARGET GENE. LCX BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LCX, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LCX BINDING SITE, designated SEQ ID:12109, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24831] Another function of GAM148 is therefore inhibition of LCX (Accession XP_167612.2) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LCX.

[24832] LOC122183 (Accession XP_062994.2) is another GAM148 target gene, herein designated TARGET GENE. LOC122183 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC122183, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC122183 BINDING SITE, designated SEQ ID:5819, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24833] Another function of GAM148 is therefore inhibition of LOC122183 (Accession XP_062994.2) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122183.

[24834] LOC126299 (Accession XP_059019.2) is another GAM148

target gene, herein designated TARGET GENE. LOC126299 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC126299, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC126299 BINDING SITE, designated SEQ ID:3713, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24835] Another function of GAM148 is therefore inhibition of LOC126299 (Accession XP_059019.2) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126299.

[24836] LOC145268 (Accession XP_085072.1) is another GAM148 target gene, herein designated TARGET GENE. LOC145268 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC145268, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145268 BINDING SITE, designated SEQ ID:10503, to the nucleotide sequence of GAM148 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:280.

[24837] Another function of GAM148 is therefore inhibition of LOC145268 (Accession XP_085072.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145268.

[24838] LOC150095 (Accession XP_097805.1) is another GAM148 target gene, herein designated TARGET GENE. LOC150095 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC150095, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150095 BINDING SITE, designated SEQ ID:553, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24839] Another function of GAM148 is therefore inhibition of LOC150095 (Accession XP_097805.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150095.

[24840] LOC150297 (Accession XP_086894.2) is another GAM148 target gene, herein designated TARGET GENE. LOC150297

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150297, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150297 BINDING SITE, designated SEQ ID:14830, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24841] Another function of GAM148 is therefore inhibition of LOC150297 (Accession XP_086894.2) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150297.

[24842] LOC196337 (Accession XP_113696.1) is another GAM148 target gene, herein designated TARGET GENE. LOC196337 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC196337, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC196337 BINDING SITE, designated SEQ ID:18591, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24843] Another function of GAM148 is therefore inhibition of LOC196337 (Accession XP_113696.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196337.

[24844] LOC199906 (Accession XP_114052.1) is another GAM148 target gene, herein designated TARGET GENE. LOC199906 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC199906, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC199906 BINDING SITE, designated SEQ ID:1048, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24845] Another function of GAM148 is therefore inhibition of LOC199906 (Accession XP_114052.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199906.

[24846] LOC219649 (Accession XP_167562.1) is another GAM148 target gene, herein designated TARGET GENE. LOC219649 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC219649, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC219649 BINDING SITE, designated SEQ ID:1391, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24847] Another function of GAM148 is therefore inhibition of LOC219649 (Accession XP_167562.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219649.

[24848] LOC283007 (Accession XP_210849.1) is another GAM148 target gene, herein designated TARGET GENE. LOC283007 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283007, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283007 BINDING SITE, designated SEQ ID:3635, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24849] Another function of GAM148 is therefore inhibition of

LOC283007 (Accession XP_210849.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283007.

[24850] LOC283511 (Accession XP_211077.1) is another GAM148 target gene, herein designated TARGET GENE. LOC283511 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283511, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283511 BINDING SITE, designated SEQ ID:9199, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24851] Another function of GAM148 is therefore inhibition of LOC283511 (Accession XP_211077.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283511.

[24852] LOC283767 (Accession XP_208835.1) is another GAM148 target gene, herein designated TARGET GENE. LOC283767 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283767, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283767 BINDING SITE, designated SEQ ID:640, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24853] Another function of GAM148 is therefore inhibition of LOC283767 (Accession XP_208835.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283767.

[24854] LOC283868 (Accession XP_211243.1) is another GAM148 target gene, herein designated TARGET GENE. LOC283868 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283868, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283868 BINDING SITE, designated SEQ ID:7128, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24855] Another function of GAM148 is therefore inhibition of LOC283868 (Accession XP_211243.1) . Accordingly, utili-

ties of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283868.

[24856] LOC284169 (Accession XP_211360.1) is another GAM148 target gene, herein designated TARGET GENE. LOC284169 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284169, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284169 BINDING SITE, designated SEQ ID:18426, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24857] Another function of GAM148 is therefore inhibition of LOC284169 (Accession XP_211360.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284169.

[24858] LOC284175 (Accession XP_211364.1) is another GAM148 target gene, herein designated TARGET GENE. LOC284175 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284175, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284175 BINDING SITE, designated SEQ ID:1975, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24859] Another function of GAM148 is therefore inhibition of LOC284175 (Accession XP_211364.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284175.

[24860] LOC284927 (Accession XP_211689.1) is another GAM148 target gene, herein designated TARGET GENE. LOC284927 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284927, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284927 BINDING SITE, designated SEQ ID:5418, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24861] Another function of GAM148 is therefore inhibition of LOC284927 (Accession XP_211689.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC284927.

[24862] LOC285194 (Accession XP_211803.1) is another GAM148 target gene, herein designated TARGET GENE. LOC285194 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285194, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285194 BINDING SITE, designated SEQ ID:16431, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24863] Another function of GAM148 is therefore inhibition of LOC285194 (Accession XP_211803.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285194.

[24864] LOC285587 (Accession XP_211947.1) is another GAM148 target gene, herein designated TARGET GENE. LOC285587 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285587, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC285587 BINDING SITE, designated SEQ ID:5312, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24865] Another function of GAM148 is therefore inhibition of LOC285587 (Accession XP_211947.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285587.

[24866] LOC285594 (Accession XP_211946.2) is another GAM148 target gene, herein designated TARGET GENE. LOC285594 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285594, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285594 BINDING SITE, designated SEQ ID:2211, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24867] Another function of GAM148 is therefore inhibition of LOC285594 (Accession XP_211946.2) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC285594.

[24868] LOC285843 (Accession XP_212034.1) is another GAM148 target gene, herein designated TARGET GENE. LOC285843 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285843, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285843 BINDING SITE, designated SEQ ID:14325, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24869] Another function of GAM148 is therefore inhibition of LOC285843 (Accession XP_212034.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285843.

[24870] LOC286058 (Accession XP_212158.1) is another GAM148 target gene, herein designated TARGET GENE. LOC286058 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286058, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC286058 BINDING SITE, designated SEQ ID:15183, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24871] Another function of GAM148 is therefore inhibition of LOC286058 (Accession XP_212158.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286058.

[24872] LOC286063 (Accession XP_212159.1) is another GAM148 target gene, herein designated TARGET GENE. LOC286063 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286063, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286063 BINDING SITE, designated SEQ ID:1688, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24873] Another function of GAM148 is therefore inhibition of LOC286063 (Accession XP_212159.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286063.

[24874] LOC338817 (Accession XP_290588.1) is another GAM148 target gene, herein designated TARGET GENE. LOC338817 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC338817, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338817 BINDING SITE, designated SEQ ID:15148, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24875] Another function of GAM148 is therefore inhibition of LOC338817 (Accession XP_290588.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338817.

[24876] LOC338991 (Accession XP_290663.1) is another GAM148 target gene, herein designated TARGET GENE. LOC338991 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC338991, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338991 BINDING SITE, designated SEQ ID:640, to

the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24877] Another function of GAM148 is therefore inhibition of LOC338991 (Accession XP_290663.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338991.

[24878] LOC338999 (Accession XP_290659.1) is another GAM148 target gene, herein designated TARGET GENE. LOC338999 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC338999, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338999 BINDING SITE, designated SEQ ID:640, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24879] Another function of GAM148 is therefore inhibition of LOC338999 (Accession XP_290659.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338999.

[24880] LOC339717 (Accession XP_295040.1) is another GAM148

target gene, herein designated TARGET GENE. LOC339717 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339717, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339717 BINDING SITE, designated SEQ ID:7535, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24881] Another function of GAM148 is therefore inhibition of LOC339717 (Accession XP_295040.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339717.

[24882] LOC340150 (Accession XP_295167.1) is another GAM148 target gene, herein designated TARGET GENE. LOC340150 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340150, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340150 BINDING SITE, designated SEQ ID:5873, to the nucleotide sequence of GAM148 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:280.

[24883] Another function of GAM148 is therefore inhibition of LOC340150 (Accession XP_295167.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340150.

[24884] LOC340385 (Accession XP_291261.1) is another GAM148 target gene, herein designated TARGET GENE. LOC340385 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC340385, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340385 BINDING SITE, designated SEQ ID:12963, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24885] Another function of GAM148 is therefore inhibition of LOC340385 (Accession XP_291261.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340385.

[24886] LOC343095 (Accession XP_291404.1) is another GAM148 target gene, herein designated TARGET GENE. LOC343095

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC343095, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC343095 BINDING SITE, designated SEQ ID:5934, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24887] Another function of GAM148 is therefore inhibition of LOC343095 (Accession XP_291404.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC343095.

[24888] LOC348113 (Accession XP_300623.1) is another GAM148 target gene, herein designated TARGET GENE. LOC348113 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348113, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348113 BINDING SITE, designated SEQ ID:640, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24889] Another function of GAM148 is therefore inhibition of LOC348113 (Accession XP_300623.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348113.

[24890] LOC348137 (Accession XP_300635.1) is another GAM148 target gene, herein designated TARGET GENE. LOC348137 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348137, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348137 BINDING SITE, designated SEQ ID:640, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24891] Another function of GAM148 is therefore inhibition of LOC348137 (Accession XP_300635.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348137.

[24892] LOC348142 (Accession XP_300636.1) is another GAM148 target gene, herein designated TARGET GENE. LOC348142 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC348142, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348142 BINDING SITE, designated SEQ ID:640, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24893] Another function of GAM148 is therefore inhibition of LOC348142 (Accession XP_300636.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348142.

[24894] LOC348180 (Accession XP_300650.1) is another GAM148 target gene, herein designated TARGET GENE. LOC348180 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348180, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348180 BINDING SITE, designated SEQ ID:12165, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24895] Another function of GAM148 is therefore inhibition of

LOC348180 (Accession XP_300650.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348180.

[24896] LOC348361 (Accession XP_302730.1) is another GAM148 target gene, herein designated TARGET GENE. LOC348361 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348361, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348361 BINDING SITE, designated SEQ ID:624, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24897] Another function of GAM148 is therefore inhibition of LOC348361 (Accession XP_302730.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348361.

[24898] LOC348369 (Accession XP_302732.1) is another GAM148 target gene, herein designated TARGET GENE. LOC348369 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348369, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348369 BINDING SITE, designated SEQ ID:15542, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24899] Another function of GAM148 is therefore inhibition of LOC348369 (Accession XP_302732.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348369.

[24900] LOC348911 (Accession XP_302915.1) is another GAM148 target gene, herein designated TARGET GENE. LOC348911 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348911, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348911 BINDING SITE, designated SEQ ID:15228, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24901] Another function of GAM148 is therefore inhibition of LOC348911 (Accession XP_302915.1) . Accordingly, utili-

ties of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348911.

[24902] LOC349251 (Accession XP_300251.1) is another GAM148 target gene, herein designated TARGET GENE. LOC349251 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC349251, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349251 BINDING SITE, designated SEQ ID:4297, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24903] Another function of GAM148 is therefore inhibition of LOC349251 (Accession XP_300251.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349251.

[24904] LOC55924 (Accession NP_061972.1) is another GAM148 target gene, herein designated TARGET GENE. LOC55924 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC55924, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC55924 BINDING SITE, designated SEQ ID:3949, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24905] Another function of GAM148 is therefore inhibition of LOC55924 (Accession NP_061972.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC55924.

[24906] Mitogen-activated protein kinase kinase kinase 13 (MAP3K13, Accession NP_004712.1) is another GAM148 target gene, herein designated TARGET GENE. MAP3K13 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MAP3K13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAP3K13 BINDING SITE, designated SEQ ID:16657, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24907] Another function of GAM148 is therefore inhibition of Mitogen-activated protein kinase kinase kinase 13

(MAP3K13, Accession NP_004712.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K13.

[24908] Membrane-bound transcription factor protease, site 1 (MBTPS1, Accession NP_003782.1) is another GAM148 target gene, herein designated TARGET GENE. MBTPS1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MBTPS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MBTPS1 BINDING SITE, designated SEQ ID:10515, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24909] Another function of GAM148 is therefore inhibition of Membrane-bound transcription factor protease, site 1 (MBTPS1, Accession NP_003782.1), a gene which catalyzes the first step in the proteolytic activation of the sterol regulatory element- binding proteins (srebps). Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBTPS1.

[24910] The function of MBTPS1 has been established by previous studies. The lipid composition of animal cells is controlled by sterol regulatory element binding proteins (SREBPs; OMIM Ref. No. 184756), transcription factors released from membranes by sterol- regulated proteolysis (Brown and Goldstein, 1997). Release is initiated by site- 1 protease (S1P), which cleaves SREBPs in the endoplasmic reticulum (ER) luminal loop between 2 membrane- spanning regions (Sakai et al., 1996). The cleavage recognition sequence of S1P is the pentapeptide RSVLS (Duncan et al., 1997). To clone S1P, Sakai et al. (1998) prepared pCMV- PLAP- BP2, which encodes a fusion protein that contains placental alkaline phosphatase (PLAP; 171800) in the ER lumen flanked by cleavage sites for signal peptidase and S1P. In sterol- deprived cells, cleavage by both proteases leads to PLAP secretion. PLAP is not secreted by SRD- 12B cells, cholesterol auxotrophs that lack S1P. Sakai et al. (1998) transfected SRD- 12B cells with pCMV- PLAP- BP2 plus pools of CHO cDNAs and identified a cDNA that restored site- 1 cleavage and PLAP secretion. The cDNA encodes S1P, an intraluminal 1,052- amino acid membrane- bound subtilisin- like protease. The authors proposed that S1P is the sterol- regulated protease that controls

lipid metabolism in animal cells. Nakajima et al. (2000) localized the human S1P gene to 16q24 by FISH and radiation hybrid mapping. They showed that the gene is more than 60 kb long and contains 23 exons. Its transcription initiation site within exon 1 is separate from the initiation codon in exon 2. Analysis of the exon/intron structure showed that the S1P gene consists of a mosaic of functional units: exon 1 encodes the 5- prime untranslated region; exon 2 encodes the NH2- terminal signal sequence; and exons 2 and 3 encode the propeptide sequence that is released when S1P is self- activated by intramolecular cleavage. Exons 5- 10 encode the subtilisin-homology domain that is critical for catalytic activity, and exon 23 encodes the transmembrane region. Analysis of the putative promoter region revealed a highly GC- rich region containing a binding site for SREBP1, as well as Sp1 (OMIM Ref. No. 189906) and AP2 (OMIM Ref. No. 107580) sites. Therefore, expression of the S1P gene may be under the control of SREBP1, a key regulator of the expression of genes essential for intracellular lipid metabolism.

[24911]

[24915] Further studies establishing the function and utilities of MBTPS1 are found in John Hopkins OMIM database record ID 603355, and in cited publications listed in Table 5, which are hereby incorporated by reference.MEP50 (Accession NP_077007.1) is another GAM148 target gene, herein designated TARGET GENE. MEP50 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MEP50, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MEP50 BINDING SITE, designated SEQ ID:13864, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA,

also designated SEQ ID:280.

[24916] Another function of GAM148 is therefore inhibition of MEP50 (Accession NP_077007.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEP50.

[24917] MGC13017 (Accession NP_542387.1) is another GAM148 target gene, herein designated TARGET GENE. MGC13017 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC13017, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC13017 BINDING SITE, designated SEQ ID:18039, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24918] Another function of GAM148 is therefore inhibition of MGC13017 (Accession NP_542387.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13017.

[24919] MGC17403 (Accession NP_689847.1) is another GAM148 target gene, herein designated TARGET GENE. MGC17403 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by MGC17403, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC17403 BINDING SITE, designated SEQ ID:2263, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24920] Another function of GAM148 is therefore inhibition of MGC17403 (Accession NP_689847.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC17403.

[24921] MGC35136 (Accession NP_689640.1) is another GAM148 target gene, herein designated TARGET GENE. MGC35136 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC35136, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC35136 BINDING SITE, designated SEQ ID:13560, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24922] Another function of GAM148 is therefore inhibition of

MGC35136 (Accession NP_689640.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC35136.

[24923] Myotubularin related protein 3 (MTMR3, Accession NP_694691.1) is another GAM148 target gene, herein designated TARGET GENE. MTMR3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MTMR3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MTMR3 BINDING SITE, designated SEQ ID:17072, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24924] Another function of GAM148 is therefore inhibition of Myotubularin related protein 3 (MTMR3, Accession NP_694691.1), a gene which could be a tyrosine- phosphatase. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTMR3.

[24925] The function of MTMR3 has been established by previous studies. Zhao et al. (2001) showed that an isoform of

MTMR3, missing exon 17, dephosphorylates para- nitro- phenylphosphate and phosphatidylinositol 3- phosphate.

[24926]

[24927] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24928] Nagase, T.; Ishikawa, K.; Nakajima, D.; Ohira, M.; Seki, N.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. VII. [24930] Further studies establishing the function and utilities of MTMR3 are found in John Hopkins OMIM database record ID 603558, and in cited publications listed in Table 5, which are hereby incorporated by reference.Myotubularin related protein 3 (MTMR3, Accession NP_066576.1) is another GAM148 target gene, herein designated TARGET GENE. MTMR3 BINDING SITE is a target binding site found

in the 3` untranslated region of multiple transcripts of mRNA encoded by MTMR3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MTMR3 BINDING SITE, designated SEQ ID:17072, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24931] Another function of GAM148 is therefore inhibition of Myotubularin related protein 3 (MTMR3, Accession NP_066576.1), a gene which could be a tyrosine- phosphatase. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTMR3.

[24932] The function of MTMR3 has been established by previous studies. Zhao et al. (2001) showed that an isoform of MTMR3, missing exon 17, dephosphorylates para- nitrophenylphosphate and phosphatidylinositol 3- phosphate.

[24933]

[24934] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24935] Nagase, T.; Ishikawa, K.; Nakajima, D.; Ohira, M.; Seki, N.;

Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. VII. The complete sequences of 100 new cDNA clones from brain which can code for large proteins in vitro. DNA Res. 4: 141- 150, 1997. ; and

[24936] Zhao, R.; Qi, Y.; Chen, J.; Zhao, Z. J. : FYVE- DSP2, a FYVE domain- containing dual specificity protein phosphatase that dephosphorylates phosphotidylinositol (sic) 3- phosphate. Exp. Cel.

[24937] Further studies establishing the function and utilities of MTMR3 are found in John Hopkins OMIM database record ID 603558, and in cited publications listed in Table 5, which are hereby incorporated by reference.Myotubularin related protein 3 (MTMR3, Accession NP_694690.1) is another GAM148 target gene, herein designated TARGET GENE. MTMR3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MTMR3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MTMR3 BINDING SITE, designated SEQ ID:17072, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA,

also designated SEQ ID:280.

[24938] Another function of GAM148 is therefore inhibition of Myotubularin related protein 3 (MTMR3, Accession NP_694690.1), a gene which could be a tyrosine- phosphatase. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTMR3.

[24939] The function of MTMR3 has been established by previous studies. Zhao et al. (2001) showed that an isoform of MTMR3, missing exon 17, dephosphorylates para- nitrophenylphosphate and phosphatidylinositol 3- phosphate.

[24940]

[24941] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24942] Nagase, T.; Ishikawa, K.; Nakajima, D.; Ohira, M.; Seki, N.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. VII. [24943] Zhao, R.; Qi, Y.; Chen, J.; Zhao, Z. J. : FYVE- DSP2, a FYVE domain- containing dual specificity protein phosphatase

that dephosphorylates phosphotidylinositol (sic) 3- phosphate. Exp. Cel.

[24944] Further studies establishing the function and utilities of MTMR3 are found in John Hopkins OMIM database record ID 603558, and in cited publications listed in Table 5, which are hereby incorporated by reference.Myeloid differentiation primary response gene (88) (MYD88, Accession NP_002459.1) is another GAM148 target gene, herein designated TARGET GENE. MYD88 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MYD88, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MYD88 BINDING SITE, designated SEQ ID:10785, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24945] Another function of GAM148 is therefore inhibition of Myeloid differentiation primary response gene (88) (MYD88, Accession NP_002459.1), a gene which is involved in the toll- like receptor and il- 1 receptor signaling pathway in the innate immune response. Accordingly, utilities of GAM148 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with MYD88.

[24946] The function of MYD88 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM139.1.NECAB2 (Accession NP_061938.1) is another GAM148 target gene, herein designated TARGET GENE. NECAB2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NECAB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NECAB2 BINDING SITE, designated SEQ ID:5818, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24947] Another function of GAM148 is therefore inhibition of NECAB2 (Accession NP_061938.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NECAB2.

[24948] Neuronal cell adhesion molecule (NRCAM, Accession NP_005001.1) is another GAM148 target gene, herein designated TARGET GENE. NRCAM BINDING SITE is a target

binding site found in the 3` untranslated region of mRNA encoded by NRCAM, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NRCAM BINDING SITE, designated SEQ ID:12857, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24949] Another function of GAM148 is therefore inhibition of Neuronal cell adhesion molecule (NRCAM, Accession NP_005001.1), a gene which functions as a cell surface protein and belongs to the immunoglobulin superfamily. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRCAM.

[24950] The function of NRCAM has been established by previous studies. The cell adhesion molecules (CAMs) are a subset of the immunoglobin (Ig) superfamily found in the nervous systems of both vertebrates and invertebrates. They are usually surface membrane proteins with multiple Ig domains at their N termini followed by several fibronectin type III repeats and either a transmembrane intracellular domain or a glycophosphatidylinositol- linked membrane

anchor at the C terminus (Lane et al., 1996). The chicken Bravo/Nr- CAM was described by Grumet et al. (1991) and Kayyem et al. (1992) and shown to play a role in nervous system development. The protein interacts with other cell surface molecules of the Ig superfamily and appears to be necessary for specific pathfinding by axonal growth cones during development (Lane et al., 1996). Lane et al. (1996) cloned the human homolog (NRCAM) of the chicken gene from a fetal brain library. Like its chicken counterpart, the predicted 1,275- amino acid protein has 6 V- like Ig domains and 5 fibronectin type III repeats. The transmembrane and intracellular domains of human and chicken NRCAM are entirely conserved and the proteins are 82% identical overall. Alternative splice variants were observed involving sequence around the fifth fibronectin repeat. Northern blots showed an approximately 7- kb transcript in all tissues of adult human brain examined.

[24951]

[24952] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24953] Kayyem, J. F.; Roman, J. M.; de la Rosa, E. J.; Schwarz, U.; Dreyer, W. J. : Bravo/Nr- CAM is closely related to the cell

adhesion molecules L1 and Ng- CAM and has a similar heterodimer structure. J. Cell. Biol. 118: 1259- 1270, 1992. ; and

[24954] Lane, R. P.; Chen, X.- N.; Yamakawa, K.; Vielmetter, J.; Korenberg, J. R.; Dreyer, W. J. : Characterization of a highly conserved human homolog to the chicken neural cell surface protein.

[24955] Further studies establishing the function and utilities of NRCAM are found in John Hopkins OMIM database record ID 601581, and in cited publications listed in Table 5, which are hereby incorporated by reference.Nucleoporin 50kda (NUP50, Accession NP_009103.2) is another GAM148 target gene, herein designated TARGET GENE. NUP50 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by NUP50, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NUP50 BINDING SITE, designated SEQ ID:7777, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24956] Another function of GAM148 is therefore inhibition of Nucleoporin 50kda (NUP50, Accession NP_009103.2), a gene

which is transported through the nuclear pore complex (NPC) by the importin- alpha:beta receptor. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUP50.

[24957] The function of NUP50 has been established by previous studies. Using exon trapping and genomic sequence analysis to identify genes within 22q13.3, Trichet et al. (1999) identified NUP50, a human homolog of rat Npap60, is distantly related to the yeast Nup2 protein and belongs to the FG (phe- gly) nucleoporin family. The authors isolated a cDNA corresponding to the entire NUP50 coding sequence. The deduced 468- amino acid NUP50 protein contains 5 FG repeats. NUP50 shares 70% sequence identity with rat Npap60. However, the C- terminal end of NUP50 is 87 amino acids longer than that of Npap60. Northern blot analysis of various human tissues detected several NUP50 transcripts with different tissue specificities: a 2- kb transcript expressed at low levels in all tissues tested, but with considerably higher expression in testis, peripheral blood leukocytes, and fetal liver; a 2.8- kb transcript expressed in all tissues tested, but with highest expression in testis; a 4- kb transcript expressed

only in peripheral blood leukocytes; a 5- kb transcript expressed at similar levels in all tissues tested; and an 8- kb transcript weakly expressed in spleen, testis, ovary, and blood leukocytes. In addition, RT- PCR detected the 8- kb transcript in fetal brain. Trichet et al. (1999) found that NUP50 transcripts use at least 3 alternative polyadenylation sites and possibly have alternative 5- prime ends; they did not detect alternative splicing. Many nuclear-targeted proteins are transported through the NPC by the importin- alpha:importin- beta heterodimer (see OMIM Ref. No. 602738). Lindsay et al. (2002) showed that NUP50, a protein previously believed to be a structural component of the NPC, is a RAN (OMIM Ref. No. 601179)-binding protein and a cofactor for importin- alpha:importin- beta- mediated import. NUP50 is a tristable switch that alternates between binding modes. The C terminus binds importin- beta through RAN- GTP. The N terminus binds the C terminus of importin- alpha, while a central domain binds importin- beta. NUP50:importin- alpha:importin- beta binds cargo and can stimulate nuclear import. Endogenous NUP50 can shuttle and is accessible from the cytoplasmic side of the nuclear envelope. These findings identified NUP50 as a cofactor for importin- al-

pha:importin- beta nuclear import and as a subunit of the importin complex.

[24958]

[24959] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24960] Lindsay, M. E.; Plafker, K.; Smith, A. E.; Clurman, B. E.; Macara, I. G. : Npap60/Nup50 is a tri- stable switch that stimulates importin- alpha:beta- mediated nuclear protein import. Cell 110: 349- 360, 2002. ; and

[24961] Trichet, V.; Shkolny, D.; Dunham, I.; Beare, D.; McDermid, H. E. : Mapping and complex expression pattern of the human NPAP60L nucleoporin gene. Cytogenet. Cell Genet. 85: 221- 226, 199.

[24962] Further studies establishing the function and utilities of NUP50 are found in John Hopkins OMIM database record ID 604646, and in cited publications listed in Table 5, which are hereby incorporated by reference.Nucleoporin 50kda (NUP50, Accession NP_710151.1) is another GAM148 target gene, herein designated TARGET GENE. NUP50 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by NUP50, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NUP50 BINDING SITE, designated SEQ ID:7777, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24963] Another function of GAM148 is therefore inhibition of Nucleoporin 50kda (NUP50, Accession NP_710151.1), a gene which is transported through the nuclear pore complex (NPC) by the importin- alpha:beta receptor. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUP50.

[24964] The function of NUP50 has been established by previous studies. Using exon trapping and genomic sequence analysis to identify genes within 22q13.3, Trichet et al. (1999) identified NUP50, a human homolog of rat Npap60, is distantly related to the yeast Nup2 protein and belongs to the FG (phe- gly) nucleoporin family. The authors isolated a cDNA corresponding to the entire NUP50 coding sequence. The deduced 468- amino acid NUP50 protein contains 5 FG repeats. NUP50 shares 70% sequence identity with rat Npap60. However, the C- terminal end of NUP50 is 87 amino acids longer than that of Npap60.

Northern blot analysis of various human tissues detected several NUP50 transcripts with different tissue specificities: a 2- kb transcript expressed at low levels in all tissues tested, but with considerably higher expression in testis, peripheral blood leukocytes, and fetal liver; a 2.8-kb transcript expressed in all tissues tested, but with highest expression in testis; a 4- kb transcript expressed only in peripheral blood leukocytes; a 5- kb transcript expressed at similar levels in all tissues tested; and an 8- kb transcript weakly expressed in spleen, testis, ovary, and blood leukocytes. In addition, RT- PCR detected the 8- kb transcript in fetal brain. Trichet et al. (1999) found that NUP50 transcripts use at least 3 alternative polyadenylation sites and possibly have alternative 5- prime ends; they did not detect alternative splicing. Many nuclear-targeted proteins are transported through the NPC by the importin- alpha:importin- beta heterodimer (see OMIM Ref. No. 602738). Lindsay et al. (2002) showed that NUP50, a protein previously believed to be a structural component of the NPC, is a RAN (OMIM Ref. No. 601179)-binding protein and a cofactor for importin- alpha:importin- beta- mediated import. NUP50 is a tristable switch that alternates between binding modes. The C ter-

minus binds importin- beta through RAN- GTP. The N terminus binds the C terminus of importin- alpha, while a central domain binds importin- beta. NUP50:importin- alpha:importin- beta binds cargo and can stimulate nuclear import. Endogenous NUP50 can shuttle and is accessible from the cytoplasmic side of the nuclear envelope. These findings identified NUP50 as a cofactor for importin- alpha:importin- beta nuclear import and as a subunit of the importin complex.

[24965]

[24966] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24967] Lindsay, M. E.; Plafker, K.; Smith, A. E.; Clurman, B. E.; Macara, I. G. : Npap60/Nup50 is a tri- stable switch that stimulates importin- alpha:beta- mediated nuclear protein import. Cell 110: 349- 360, 2002. ; and

[24968] Trichet, V.; Shkolny, D.; Dunham, I.; Beare, D.; McDermid, H. E. : Mapping and complex expression pattern of the human NPAP60L nucleoporin gene. Cytogenet. Cell Genet. 85: 221- 226, 199.

[24969] Further studies establishing the function and utilities of NUP50 are found in John Hopkins OMIM database record

ID 604646, and in cited publications listed in Table 5, which are hereby incorporated by reference.Orthopedia homolog (drosophila) (OTP, Accession NP_115485.1) is another GAM148 target gene, herein designated TARGET GENE. OTP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by OTP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OTP BINDING SITE, designated SEQ ID:2151, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24970] Another function of GAM148 is therefore inhibition of Orthopedia homolog (drosophila) (OTP, Accession NP_115485.1), a gene which involves in the development of the forebrain and spinal cord. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OTP.

[24971] The function of OTP has been established by previous studies. Homeodomain genes are helix- turn- helix transcription factors that play key roles in the specification of cell fates. In the central nervous system, homeodomain genes not only position cells along an axis, but also spec-

ify cell migration patterns and may influence axonal connectivity. In an effort to identify novel homeodomain genes involved in the development of the human central nervous system, Lin et al. (1999) cloned, characterized, and mapped the human homolog of the murine homeodomain gene Orthopedia (Otp), whose product is found in multiple cell groups within the mouse hypothalamus, amygdala, and brain stem. The human OTP cDNA encodes a protein of 325 amino acids. The deduced amino acid sequence is 99% homologous to mouse Otp and demonstrated a high degree of conservation when compared to sea urchin and Drosophila Otp proteins. A single putative OTP gene product was found in 17- week human fetal brain tissue by Western blot analysis using a novel polyclonal antibody raised against a conserved 13- amino acid sequence in the C terminus of the OTP protein. Expression in the developing human hypothalamus was confirmed by immunohistochemistry. Lin et al. (1999) mapped the human OTP gene to chromosome 5q13.3 using analysis of a radiation hybrid panel and by fluorescence in situ hybridization.

[24972] Animal model experiments lend further support to the function of OTP. Acampora et al. (1999) generated mice

deficient in Otp by homologous recombination. Homozygous Otp - /- mice died soon after birth and displayed progressive impairment of crucial neuroendocrine developmental events such as reduced cell proliferation, abnormal cell migration, and failure in terminal differentiation of the parvocellular and magnocellular neurons of the anterior periventricular, paraventricular, supraoptic, and arcuate nuclei. Acampora et al. (1999) suggested that Otp and Sim1 (OMIM Ref. No. 603128) are required to maintain Brn2 (OMIM Ref. No. 600494) expression which, in turn, is required for neuronal cell lineages secreting oxytocin (OMIM Ref. No. 167050), arginine vasopressin (OMIM Ref. No. 192340), and corticotropin- releasing (OMIM Ref. No. 122560) hormones.

[24973] It is appreciated that the abovementioned animal model for OTP is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[24974] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24975] Acampora, D.; Postiglione, M. P.; Avantaggiato, V.; Di Bonito, M.; Vaccarino, F. M.; Michaud, J.; Simeone, A. :

Progressive impairment of developing neuroendocrine cell lineages in the hypothalamus of mice lacking the Orthopedia gene. Genes Dev. 13: 2787- 2800, 1999. ; and

[24976] Lin, X.; State, M. W.; Vaccarino, F. M.; Greally, J.; Hass, M.; Leckman, J. F. : Identification, chromosomal assignment, and expression analysis of the human homeodomain-containing gene.

[24977] Further studies establishing the function and utilities of OTP are found in John Hopkins OMIM database record ID 604529, and in cited publications listed in Table 5, which are hereby incorporated by reference.Procollagen c-endopeptidase enhancer (PCOLCE, Accession NP_002584.1) is another GAM148 target gene, herein designated TARGET GENE. PCOLCE BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PCOLCE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCOLCE BINDING SITE, designated SEQ ID:4646, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24978] Another function of GAM148 is therefore inhibition of

Procollagen c-endopeptidase enhancer (PCOLCE, Accession NP_002584.1), a gene which binds to the cooh- terminal propeptide of type i procollagen and enhances procollagen c- proteinase activity. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCOLCE.

[24979] The function of PCOLCE has been established by previous studies. Fibrillar collagen types I- III are synthesized as precursor molecules known as procollagens. These precursors contain amino- and carboxyl- terminal peptide extensions known as N- and C- propeptides, respectively, which are cleaved, upon secretion of procollagen from the cell, to yield the mature triple helical, highly structured fibrils. In the mouse, procollagen C- proteinase depends for full expression upon the presence of either a 55- kD glycoprotein or smaller 36- and 34- kD proteolytically processed forms of the same protein. None of the 3 enhancer proteins exhibits intrinsic procollagen processing activity, but all are capable of enhancing the activity of the C- proteinase by approximately one order of magnitude. Takahara et al. (1994) purified type I procollagen COOH-terminal proteinase enhancer, a glycoprotein that binds to the COOH- terminal propeptide of type I procollagen and

enhances C- proteinase activity, from mouse fibroblast culture medium. Sequences of mouse enhancer cDNA predicted a protein of approximately 50 kD and 468 amino acids. Human cDNAs encoded an enhancer of 449 amino acids. Mouse enhancer RNA was shown to be at highest levels in collagen- rich tissues, especially tendon. By Southern analysis of genomic DNA from panels of human/mouse cell hybrids and by fluorescence in situ hybridization, Takahara et al. (1994) localized the PCOLCE gene to 7q21.3- q22, the same region containing the type I collagen alpha- 2 chain gene (COL1A2; 120160). Takahara et al. (1996) investigated further the apparent proximity of the 2 genes by the study of somatic cell hybrids, cosmid contigs, and interspecific backcross mice. They found that PCOLCE and COL1A2 are separated by at least 6 Mb and that Pcolce and Col1a2 are located on separate chromosomes in the mouse, chromosomes 5 and 6, respectively.

[24980]

[24981] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24982] Takahara, K.; Kessler, E.; Biniaminov, L.; Brusel, M.; Eddy, R. L.; Jani- Sait, S.; Shows, T. B.; Greenspan, D. S. : Type I

procollagen COOH- terminal proteinase enhancer protein: identification, primary structure, and chromosomal localization of the cognate human gene (PCOLCE). J. Biol. Chem. 269: 26280- 26285, 1994. ; and

[24983] Takahara, K.; Osborne, L.; Elliott, R. W.; Tsui, L.- C.; Scherer, S. W.; Greenspan, D. S. : Fine mapping of the human and mouse genes for the type I procollagen COOH-terminal proteinase.

[24984] Further studies establishing the function and utilities of PCOLCE are found in John Hopkins OMIM database record ID 600270, and in cited publications listed in Table 5, which are hereby incorporated by reference.Phospholipase c, delta 1 (PLCD1, Accession NP_006216.1) is another GAM148 target gene, herein designated TARGET GENE. PLCD1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PLCD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PLCD1 BINDING SITE, designated SEQ ID:8152, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24985] Another function of GAM148 is therefore inhibition of

Phospholipase c, delta 1 (PLCD1, Accession NP_006216.1), a gene which acts as a signal transducer that generates 2 messengers, diacylglycerol and inositol 1,4,5- trisphosphate and therefore may be associated with Alzheimer disease. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of Alzheimer disease, and of other diseases and clinical conditions associated with PLCD1.

[24986] The function of PLCD1 has been established by previous studies. Phosphoinositide- specific phospholipase C acts as a signal transducer that generates 2 messengers, diacylglycerol and inositol 1,4,5- trisphosphate, by hydrolyzing inositol phospholipids. Molecules belonging to the PLC family are divided into subfamilies, PLC- beta (see OMIM Ref. No. 600810), PLC- gamma (see OMIM Ref. No. 172420), and PLC- delta, whose amino acid sequences are highly conserved in 2 distinct regions designated X and Y. PLC- delta- 1 is distinguished from PLC- gamma by lack of the SH2 and SH3 domains that are essential for activation of PLC- gamma by tyrosine protein kinases, and from PLC- beta by lack of the C- terminal region of PLC- beta that is responsible for binding and activation by G proteins. Cheng et al. (1995) cloned cDNA for human PLC-

delta- 1 and localized the gene to chromosome 3 by means of a human/rodent somatic cell panel (Lyu et al., 1996). In the course of a large- scale sequencing analysis of genomic DNA in the vicinity of the homozygous deletion on chromosome 3p found in a lung cancer cell line, Ishikawa et al. (1997) found that the gene encoding phospholipase C, delta- 1 (PLCD1) is located just distal to the region removed by the deletion. They found that the gene consists of 15 exons and spans about 22 kb. By fluorescence in situ hybridization, they localized the PLCD1 gene to 3p22- p21.3. Shimohama et al. (1998) examined the entire sequences corresponding to protein- coding exons 2- 15 of the hamster PLC- delta- 1 gene in genomic DNA derived from the leukocytes of 13 unrelated patients with early- onset sporadic Alzheimer disease (OMIM Ref. No. 104300). In 1 of these patients whose clinical features and course did not differ from those of the other 12 cases, they found a change of codon CGC (arg) to CAC (his), located in the pleckstrin homology domain of the PLCD1 gene. They stated that this was the first mutation found in the human PLC genes. Site- directed mutagenesis of the glutathione- S- transferase (GST/PLCD1) fusion protein changing arg105 to his resulted in a 4- fold decrease in

the affinity of specific binding and a reduction in hydrolyzing activity to about 40% of that of the wildtype enzyme. This remarkable loss of function could be interpreted in terms of a conformational change in the pleckstrin homology domain. Shimohama et al. (1998) found that the arg105- to- his mutation was present in heterozygous state in the patient with AD. The mutation was not found in DNA extracted from leukocytes of 23 unrelated patients with familial AD, 23 unrelated patients with early- onset sporadic AD, 46 unrelated patients with late-onset sporadic AD, and 456 nondemented control subjects. Thus the change did not appear to be a common polymorphism. However, determination of the possible pathologic role required transgenic studies of the mutant gene to determine the role of the enzyme and the mutation and a search for other mutations in the pleckstrin homology domain of PLC genes in human subjects with genetic disorders. They pointed out that mutations in the pleckstrin homology domain of the BTK gene occur in patients with Bruton agammaglobulinemia (OMIM Ref. No. 300300).

[24987]

[24988] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[24989] Cheng, H. F.; Jiang, M. J.; Chen, C. L.; Liu, S. M.; Wong, L. P.; Lomasney, J. W.; King, K. : Cloning and identification of amino acid residues of human phospholipase C delta 1 essential for catalysis. J. Biol. Chem. 270: 5495- 5505, 1995. ; and

[24990] Ishikawa, S.; Takahashi, T.; Ogawa, M.; Nakamura, Y. : Genomic structure of the human PLCD1 (phospholipase C delta 1) locus on 3p22- p21.3. Cytogenet. Cell Genet. 78: 58- 60, 1997.

[24991] Further studies establishing the function and utilities of PLCD1 are found in John Hopkins OMIM database record ID 602142, and in cited publications listed in Table 5, which are hereby incorporated by reference.PP2447 (Accession NP_079480.1) is another GAM148 target gene, herein designated TARGET GENE. PP2447 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PP2447, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PP2447 BINDING SITE, designated SEQ ID:10796, to the nucleotide se-

quence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24992] Another function of GAM148 is therefore inhibition of PP2447 (Accession NP_079480.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP2447.

[24993] Protein phosphatase 1, regulatory (inhibitor) subunit 11 (PPP1R11, Accession NP_740751.1) is another GAM148 target gene, herein designated TARGET GENE. PPP1R11 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PPP1R11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPP1R11 BINDING SITE, designated SEQ ID:15269, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24994] Another function of GAM148 is therefore inhibition of Protein phosphatase 1, regulatory (inhibitor) subunit 11 (PPP1R11, Accession NP_740751.1), a gene which inhibits rabbit muscle protein phosphatase- 1 in vitro . Accordingly, utilities of GAM148 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with PPP1R11.

[24995] The function of PPP1R11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM94.1.Protein phosphatase 1, regulatory (inhibitor) subunit 11 (PPP1R11, Accession NP_068778.1) is another GAM148 target gene, herein designated TARGET GENE. PPP1R11 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PPP1R11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPP1R11 BINDING SITE, designated SEQ ID:15269, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24996] Another function of GAM148 is therefore inhibition of Protein phosphatase 1, regulatory (inhibitor) subunit 11 (PPP1R11, Accession NP_068778.1), a gene which inhibits rabbit muscle protein phosphatase- 1 in vitro . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with PPP1R11.

[24997] The function of PPP1R11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM94.1.Protein phosphatase 2a, regulatory subunit b' (pr 53) (PPP2R4, Accession NP_821069.1) is another GAM148 target gene, herein designated TARGET GENE. PPP2R4 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PPP2R4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPP2R4 BINDING SITE, designated SEQ ID:14893, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[24998] Another function of GAM148 is therefore inhibition of Protein phosphatase 2a, regulatory subunit b' (pr 53) (PPP2R4, Accession NP_821069.1), a gene which is a regulatory subunit of protein phosphatase 2A. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP2R4.

[24999] The function of PPP2R4 has been established by previous studies. McCright et al. (1996) stated that PP2A contains a 36- kD catalytic C subunit (OMIM Ref. No. 176915) and a 65- kD structural/regulatory A subunit. Association of this dimeric core of PP2A with a third regulatory subunit (PR54, PR55, PR72, PR74, PR130, etc.) results in the formation of a specific trimeric holoenzyme. The PPP2R4 gene (which the authors symbolized PTPA) encodes a specific phosphotyrosyl phosphatase activator of the dimeric form of protein phosphatase 2A. Van Hoof et al. (1995) demonstrated that human PTPA is encoded by a single-copy gene composed of 10 exons and 9 introns with a total length of about 60 kb. The 5- prime flanking sequence of the transcription start site was analyzed for its potential as a promoter. This region lacks a TATA sequence in the appropriate position relative to the transcription start. However, this region is very GC- rich and contains four Sp1 sites (SP1; 189906) upstream of the transcription start site, a feature common to many TATA- less promoters. Based on homology with DNA- binding consensus sequences of transcription factors, Van Hoof et al. (1995) identified several additional putative transcription factor binding sites in the promoter region. Transfection experi-

ments with a construct containing the PTPA promoter region inserted 5- prime of a luciferase reporter gene demonstrated that the 5- prime flanking sequence of the PTPA gene indeed has promoter activity that seems to be cell- line dependent. By fluorescence in situ hybridization, Van Hoof et al. (1995) mapped the PTPA gene to 9q34. Fluorescence in situ analysis of metaphase chromosomes of patients bearing the Philadelphia chromosome indicated that PTPA is positioned centromeric of ABL1 (OMIM Ref. No. 189980) and probably is not involved in chronic myeloid leukemia.

[25000]

[25001] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25002] McCright, B.; Rivers, A. M.; Audlin, S.; Virshup, D. M. : The B56 family of protein phosphatase 2A (PP2A) regulatory subunits encodes differentiation- induced phosphoproteins that target PP2A to both nucleus and cytoplasm. J. Biol. Chem. 271: 22081- 22089, 1996. ; and

[25003] Van Hoof, C.; Aly, M. S.; Garcia, A.; Cayla, X.; Cassiman, J. J.; Merlevede, W.; Goris, J. : Structure and chromosomal localization of the human gene of the phosphotyrosyl

phosphatase a.

[25004] Further studies establishing the function and utilities of PPP2R4 are found in John Hopkins OMIM database record ID 600756, and in cited publications listed in Table 5, which are hereby incorporated by reference.Proline rich 2 (PROL2, Accession NP_006804.1) is another GAM148 target gene, herein designated TARGET GENE. PROL2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PROL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PROL2 BINDING SITE, designated SEQ ID:17200, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[25005] Another function of GAM148 is therefore inhibition of Proline rich 2 (PROL2, Accession NP_006804.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PROL2.

[25006] Prostaglandin f2 receptor negative regulator (PTGFRN, Accession XP_040709.3) is another GAM148 target gene, herein designated TARGET GENE. PTGFRN BINDING SITE is

a target binding site found in the 3` untranslated region of mRNA encoded by PTGFRN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTGFRN BINDING SITE, designated SEQ ID:14508, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[25007] Another function of GAM148 is therefore inhibition of Prostaglandin f2 receptor negative regulator (PTGFRN, Accession XP_040709.3), a gene which inhibits the binding of prostaglandin f2- alpha (pgf2- alpha) to its specific fp receptor. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGFRN.

[25008] The function of PTGFRN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM94.1.Prostaglandin i2 (prostacyclin) synthase (PTGIS, Accession NP_000952.1) is another GAM148 target gene, herein designated TARGET GENE. PTGIS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PTGIS, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTGIS BINDING SITE, designated SEQ ID:15201, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[25009] Another function of GAM148 is therefore inhibition of Prostaglandin i2 (prostacyclin) synthase (PTGIS, Accession NP_000952.1), a gene which catalyzes the isomerization of prostaglandin h2 to prostacyclin (= prostaglandin i2). Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGIS.

[25010] The function of PTGIS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Protein tyrosine phosphatase, non-receptor type substrate 1 (PTPNS1, Accession NP_542970.1) is another GAM148 target gene, herein designated TARGET GENE. PTPNS1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PTPNS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of

Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTPNS1 BINDING SITE, designated SEQ ID:9261, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[25011] Another function of GAM148 is therefore inhibition of Protein tyrosine phosphatase, non-receptor type substrate 1 (PTPNS1, Accession NP_542970.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPNS1.

[25012] Rad52 homolog (s. cerevisiae) (RAD52, Accession NP_602295.1) is another GAM148 target gene, herein designated TARGET GENE. RAD52 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RAD52, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAD52 BINDING SITE, designated SEQ ID:9644, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[25013] Another function of GAM148 is therefore inhibition of Rad52 homolog (s. cerevisiae) (RAD52, Accession

NP_602295.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD52.

[25014] SBLF (Accession NP_006864.2) is another GAM148 target gene, herein designated TARGET GENE. SBLF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SBLF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SBLF BINDING SITE, designated SEQ ID:5432, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[25015] Another function of GAM148 is therefore inhibition of SBLF (Accession NP_006864.2) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SBLF.

[25016] Src family associated phosphoprotein 1 (SCAP1, Accession NP_003717.2) is another GAM148 target gene, herein designated TARGET GENE. SCAP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SCAP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SCAP1 BINDING SITE, designated SEQ ID:13627, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[25017] Another function of GAM148 is therefore inhibition of Src family associated phosphoprotein 1 (SCAP1, Accession NP_003717.2) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCAP1.

[25018] Sidekick homolog 1 (chicken) (SDK1, Accession NP_689957.1) is another GAM148 target gene, herein designated TARGET GENE. SDK1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SDK1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SDK1 BINDING SITE, designated SEQ ID:16745, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[25019] Another function of GAM148 is therefore inhibition of Sidekick homolog 1 (chicken) (SDK1, Accession

NP_689957.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDK1.

[25020] Solute carrier family 21 (prostaglandin transporter), member 2 (SLC21A2, Accession NP_005621.1) is another GAM148 target gene, herein designated TARGET GENE. SLC21A2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC21A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC21A2 BINDING SITE, designated SEQ ID:10394, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[25021] Another function of GAM148 is therefore inhibition of Solute carrier family 21 (prostaglandin transporter), member 2 (SLC21A2, Accession NP_005621.1), a gene which is a Prostaglandin transporter. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC21A2.

[25022] The function of SLC21A2 has been established by previous studies. At physiologic pH, prostaglandins (PGs) traverse biologic membranes poorly. Accordingly, PG trans-

port is carrier- mediated in many tissues, including the lung, choroid plexus, liver, anterior chamber of the eye, vagina and uterus, and placenta. Kanai et al. (1995) cloned the rat prostaglandin transporter (symbolized PGT by them) and postulated 3 possible roles for the transporter. First, PGT might mediate the efflux of newly synthesized PGs from cells. Second, PGT might mediate epithelial PG transport. A third possible role of PGT is that of mediating PG clearance and degradation. Lu et al. (1996) favored the clearance role for PGT. Using a rat PGT probe on Northern blots of human kidney mRNA, they found evidence for the presence of a human PGT homolog. They screened a human kidney cDNA library and isolated human PGT. The gene encodes a 643- amino acid polypeptide with 82% identity to the rat protein. They expressed a full- length human cDNA clone in cultured cells and reported that both rat and human PGT transport PGD2, as well as PGE1, PGE2, and PGF2a. Although human PGT has cDNA and deduced amino acid sequences similar to those of the rat, the tissue distribution of mRNA transcripts is substantially broader in human. Additionally, the diversity of human PGT transcripts is greater and the affinity for thromboxane- 2 is greater. Lu et al. (1996) found strong

PGT mRNA expression in the human fetus. By PCR- based monochromosomal somatic cell hybrid mapping and fluorescence in situ hybridization, Lu and Schuster (1998) mapped the PGT gene to 3q21.

[25023]

[25024] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25025] Kanai, N.; Lu, R.; Satriano, J. A.; Bao, Y.; Wolkoff, A. W.; Schuster, V. L. : Identification and characterization of a prostaglandin transporter. Science 268: 866- 869, 1995. ; and

[25026] Lu, R.; Kanai, N.; Bao, Y.; Schuster, V. L. : Cloning, in vitro expression, and tissue distribution of a human prostaglandin transporter cDNA (hPGT). J. Clin. Invest. 98: 1142- 1149, 1996.

[25027] Further studies establishing the function and utilities of SLC21A2 are found in John Hopkins OMIM database record ID 601460, and in cited publications listed in Table 5, which are hereby incorporated by reference.Solute carrier family 25 (mitochondrial carrier; citrate transporter), member 1 (SLC25A1, Accession NP_005975.1) is another GAM148 target gene, herein designated TARGET GENE.

SLC25A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC25A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC25A1 BINDING SITE, designated SEQ ID:16041, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[25028] Another function of GAM148 is therefore inhibition of Solute carrier family 25 (mitochondrial carrier; citrate transporter), member 1 (SLC25A1, Accession NP_005975.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC25A1.

[25029] SMO (Accession NP_005622.1) is another GAM148 target gene, herein designated TARGET GENE. SMO BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SMO, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SMO BINDING SITE, designated SEQ ID:19323, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA,

also designated SEQ ID:280.

[25030] Another function of GAM148 is therefore inhibition of SMO (Accession NP_005622.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMO.

[25031] Small nuclear ribonucleoprotein d3 polypeptide 18kda (SNRPD3, Accession NP_004166.1) is another GAM148 target gene, herein designated TARGET GENE. SNRPD3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SNRPD3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SNRPD3 BINDING SITE, designated SEQ ID:2958, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[25032] Another function of GAM148 is therefore inhibition of Small nuclear ribonucleoprotein d3 polypeptide 18kda (SNRPD3, Accession NP_004166.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNRPD3.

[25033] SNX27 (Accession NP_112180.4) is another GAM148 tar-

get gene, herein designated TARGET GENE. SNX27 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SNX27, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SNX27 BINDING SITE, designated SEQ ID:19179, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[25034] Another function of GAM148 is therefore inhibition of SNX27 (Accession NP_112180.4) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX27.

[25035] Spondin 1, (f-spondin) extracellular matrix protein (SPON1, Accession NP_006099.1) is another GAM148 target gene, herein designated TARGET GENE. SPON1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SPON1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SPON1 BINDING SITE, designated SEQ ID:2566, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA,

also designated SEQ ID:280.

[25036] Another function of GAM148 is therefore inhibition of Spondin 1, (f-spondin) extracellular matrix protein (SPON1, Accession NP_006099.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPON1.

[25037] Sprouty homolog 4 (drosophila) (SPRY4, Accession NP_112226.2) is another GAM148 target gene, herein designated TARGET GENE. SPRY4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SPRY4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SPRY4 BINDING SITE, designated SEQ ID:18907, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[25038] Another function of GAM148 is therefore inhibition of Sprouty homolog 4 (drosophila) (SPRY4, Accession NP_112226.2) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPRY4.

[25039] Spectrin, beta, non-erythrocytic 2 (SPTBN2, Accession

NP_008877.1) is another GAM148 target gene, herein designated TARGET GENE. SPTBN2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SPTBN2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SPTBN2 BINDING SITE, designated SEQ ID:11121, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[25040] Another function of GAM148 is therefore inhibition of Spectrin, beta, non-erythrocytic 2 (SPTBN2, Accession NP_008877.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPTBN2.

[25041] Steroid-5-alpha-reductase, alpha polypeptide 2 (3-oxo-5 alpha-steroid delta 4-dehydrogenase alpha 2) (SRD5A2, Accession NP_000339.1) is another GAM148 target gene, herein designated TARGET GENE. SRD5A2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SRD5A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of SRD5A2 BINDING SITE, designated SEQ ID:13219, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[25042] Another function of GAM148 is therefore inhibition of Steroid-5-alpha-reductase, alpha polypeptide 2 (3-oxo-5 alpha-steroid delta 4-dehydrogenase alpha 2) (SRD5A2, Accession NP_000339.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRD5A2.

[25043] Steroidogenic acute regulatory protein (STAR, Accession NP_000340.1) is another GAM148 target gene, herein designated TARGET GENE. STAR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by STAR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STAR BINDING SITE, designated SEQ ID:10859, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[25044] Another function of GAM148 is therefore inhibition of Steroidogenic acute regulatory protein (STAR, Accession

NP_000340.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAR.

[25045] Synaptotagmin xiii (SYT13, Accession NP_065877.1) is another GAM148 target gene, herein designated TARGET GENE. SYT13 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SYT13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SYT13 BINDING SITE, designated SEQ ID:9376, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[25046] Another function of GAM148 is therefore inhibition of Synaptotagmin xiii (SYT13, Accession NP_065877.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYT13.

[25047] Tolloid-like 1 (TLL1, Accession NP_036596.3) is another GAM148 target gene, herein designated TARGET GENE. TLL1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TLL1, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TLL1 BINDING SITE, designated SEQ ID:13124, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[25048] Another function of GAM148 is therefore inhibition of Tolloid-like 1 (TLL1, Accession NP_036596.3), a gene which is involved in bone morphogenesis. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TLL1.

[25049] The function of TLL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM106.1.Transmembrane 7 superfamily member 2 (TM7SF2, Accession NP_003264.1) is another GAM148 target gene, herein designated TARGET GENE. TM7SF2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TM7SF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TM7SF2 BINDING SITE, designated SEQ ID:11046, to the

nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[25050] Another function of GAM148 is therefore inhibition of Transmembrane 7 superfamily member 2 (TM7SF2, Accession NP_003264.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TM7SF2.

[25051] Tumor necrosis factor receptor superfamily, member 14 (herpesvirus entry mediator) (TNFRSF14, Accession NP_003811.2) is another GAM148 target gene, herein designated TARGET GENE. TNFRSF14 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TNFRSF14, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TNFRSF14 BINDING SITE, designated SEQ ID:5580, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[25052] Another function of GAM148 is therefore inhibition of Tumor necrosis factor receptor superfamily, member 14 (herpesvirus entry mediator) (TNFRSF14, Accession NP_003811.2), a gene which mediates entry of herpes

simplex virus (HSV). Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF14.

[25053] The function of TNFRSF14 has been established by previous studies. Members of the tumor necrosis factor receptor (TNFR) family play a key role in regulating the immune response to infection (see OMIM Ref. No. TNFR1, 191190). By screening for genes that mediate the entry of herpes simplex virus (HSV) into Chinese hamster ovary (CHO) cells, Montgomery et al. (1996) identified cDNAs encoding a member of the TNFR family. They designated the gene HVEM (herpesvirus entry mediator). The predicted 283-amino acid protein had characteristics of a type I membrane glycoprotein, with an N- terminal signal peptide, 2 potential sites for addition of N- linked glycans, and a putative membrane- spanning domain. Sequence analysis revealed that HVEM contained a cysteine- rich repeat region characteristic of TNFR family members, and shared 17 to 25% amino acid identity with other TNFRs. Montgomery et al. (1996) suggested that HVEM plays an important role in HSV pathogenesis because it enhanced the entry of several wildtype HSV strains of both serotypes into CHO cells, and mediated HSV entry into activated hu-

man T cells. Independently, Kwon et al. (1997) cloned cDNAs encoding HVEM, which they designated TR2. Northern blot analysis revealed that HVEM is expressed as a 1.7- kb mRNA in several tissues, with the highest expression in lung, spleen, and thymus. Several additional larger mRNAs were observed in some tissues and several of the cDNAs contained insertions in the coding region, leading Kwon et al. (1997) to suggest that HVEM is regulated at the level of mRNA maturation. These authors reported that the in vitro translation product was 32 kD by SDS- PAGE. HSV infection requires binding of the viral envelope glycoprotein D (gD) to cell surface receptors. Carfi et al. (2001) reported the x- ray structures of a soluble, truncated ectodomain of gD both alone and in complex with the ectodomain of its cellular receptor, TNFRSF14, which they called HVEA. Two bound anions suggested possible binding sites for another gD receptor, a 3- O- sulfonated heparan sulfate. The structures revealed a V- like immunoglobulin fold at the core of gD that is closely related to cellular adhesion molecules and flanked by large N- and C- terminal extensions. The receptor- binding segment of gD, an N- terminal hairpin, appeared conformationally flexible, suggesting that a conformational change accompanying binding

might be part of the viral entry mechanism.

[25054]

[25055] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25056] Kwon, B. S.; Tan, K. B.; Ni, J.; Oh, K.- O.; Lee, Z. H.; Kim, K. K.; Kim, Y.- J.; Wang, S.; Gentz, R.; Yu, G.- L.; Harrop, J.; Lyn, S. D.; Silverman, C.; Porter, T. G.; Truneh, A.; Young, P. R. : A newly identified member of the tumor necrosis factor receptor superfamily with a wide tissue distribution and involvement in lymphocyte activation. J. Biol. Chem. 272: 14272- 14276, 1997. ; and

[25057] Carfi, A.; Willis, S. H.; Whitbeck, J. C.; Krummenacher, C.; Cohen, G. H.; Eisenberg, R. J.; Wiley, D. C. : Herpes sim- plex virus glycoprotein D bound to the human receptor HveA. Molec.

[25058] Further studies establishing the function and utilities of TNFRSF14 are found in John Hopkins OMIM database record ID 602746, and in cited publications listed in Table 5, which are hereby incorporated by reference.Tankyrase 1 binding protein 1, 182kda (TNKS1BP1, Accession NP_203754.1) is another GAM148 target gene, herein designated TARGET GENE. TNKS1BP1 BINDING SITE is a

target binding site found in the 5` untranslated region of mRNA encoded by TNKS1BP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TNKS1BP1 BINDING SITE, designated SEQ ID:5658, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[25059] Another function of GAM148 is therefore inhibition of Tankyrase 1 binding protein 1, 182kda (TNKS1BP1, Accession NP_203754.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNKS1BP1.

[25060] TPCN1 (Accession NP_060371.2) is another GAM148 target gene, herein designated TARGET GENE. TPCN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TPCN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TPCN1 BINDING SITE, designated SEQ ID:3418, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[25061] Another function of GAM148 is therefore inhibition of TPCN1 (Accession NP_060371.2) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TPCN1.

[25062] Tnfrsf1a-associated via death domain (TRADD, Accession NP_700474.1) is another GAM148 target gene, herein designated TARGET GENE. TRADD BINDING SITE1 and TRADD BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by TRADD, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRADD BINDING SITE1 and TRADD BINDING SITE2, designated SEQ ID:3225 and SEQ ID:605 respectively, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[25063] Another function of GAM148 is therefore inhibition of Tnfrsf1a-associated via death domain (TRADD, Accession NP_700474.1), a gene which specifically interacts with the cytoplasmic domain of activated tnfr1. interacts with trafs (traf1 and traf2), fadd and rip. acts as an adaptor molecule for tnfr1 mediating its interaction with fadd.

overexpression of tradd leads to two major tnf- induced responses, apoptosis and activation of nf- kappa b. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRADD.

[25064] The function of TRADD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.TRAP240 (Accession NP_005112.1) is another GAM148 target gene, herein designated TARGET GENE. TRAP240 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TRAP240, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRAP240 BINDING SITE, designated SEQ ID:596, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[25065] Another function of GAM148 is therefore inhibition of TRAP240 (Accession NP_005112.1), a gene which Subunit of TRAP thyroid hormone receptor- associated protein complex; coactivator for nuclear receptors. Accordingly, utilities of GAM148 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with TRAP240.

[25066] The function of TRAP240 has been established by previous studies. For background information on thyroid hormone receptor- associated proteins (TRAPs), see 300182. Using a HeLa cell line, Ito et al. (1999) cloned TRAP240, the gene encoding the 240- kD subunit of the TRAP complex. The TRAP240 cDNA encodes a 2,174- amino acid protein that shows a regional identity of 29% and a similarity of 46% with a hypothetical C. elegans protein (CEK08F8 and CEF07H5). It shows no obvious relationship with known consensus sequences, other than 2 ligand-dependent nuclear hormone receptor signature recognition motifs (LXXLL sequences) at positions 1188- 1192 and 1279- 1283, and a short leucine zipper at position 1331- 1352. Northern blot analysis of multiple human tissues showed that the TRAP240 gene is ubiquitously expressed as an approximately 11.5- kb transcript. Nagase et al. (1998) also cloned the cDNA encoding TRAP240, which they referred to as KIAA0593, from a human brain cDNA library. By analysis of a human- rodent hybrid panel, Nagase et al. (1998) mapped the TRAP240 gene to chromosome 17

[25067]

[25068] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25069] Ito, M.; Yuan, C.- X.; Malik, S.; Gu, W.; Fondell, J. D.; Yamamura, S.; Fu, Z.- Y.; Zhang, X.; Qin, J.; Roeder, R. G. : Identity between TRAP and SMCC complexes indicates novel pathways for the function of nuclear receptors and diverse mammalian activators. Molec. Cell 3: 361- 370, 1999. ; and

[25070] Nagase, T.; Ishikawa, K.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. IX. The complete sequences of 100.

[25071] Further studies establishing the function and utilities of TRAP240 are found in John Hopkins OMIM database record ID 603808, and in cited publications listed in Table 5, which are hereby incorporated by reference.Three prime repair exonuclease 1 (TREX1, Accession NP_338598.1) is another GAM148 target gene, herein designated TARGET GENE. TREX1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by TREX1, correspond-

ing to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TREX1 BINDING SITE, designated SEQ ID:6080, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[25072] Another function of GAM148 is therefore inhibition of Three prime repair exonuclease 1 (TREX1, Accession NP_338598.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TREX1.

[25073] Translin (TSN, Accession NP_004613.1) is another GAM148 target gene, herein designated TARGET GENE. TSN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TSN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TSN BINDING SITE, designated SEQ ID:15704, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[25074] Another function of GAM148 is therefore inhibition of Translin (TSN, Accession NP_004613.1), a gene which is a

DNA binding protein and involved in DNA repair, replication, or recombination. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSN.

[25075] The function of TSN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM72.1.Ubiquitin associated protein 2 (UBAP2, Accession NP_680476.1) is another GAM148 target gene, herein designated TARGET GENE. UBAP2 BINDING SITE1 and UBAP2 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by UBAP2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UBAP2 BINDING SITE1 and UBAP2 BINDING SITE2, designated SEQ ID:3406 and SEQ ID:6591 respectively, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[25076] Another function of GAM148 is therefore inhibition of Ubiquitin associated protein 2 (UBAP2, Accession NP_680476.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with UBAP2.

[25077] Udp glycosyltransferase 2 family, polypeptide b4 (UGT2B4, Accession NP_066962.1) is another GAM148 target gene, herein designated TARGET GENE. UGT2B4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by UGT2B4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UGT2B4 BINDING SITE, designated SEQ ID:8980, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[25078] Another function of GAM148 is therefore inhibition of Udp glycosyltransferase 2 family, polypeptide b4 (UGT2B4, Accession NP_066962.1), a gene which is of major importance in the conjugation and subsequent elimination of potentially toxic xenobiotics and endogenous compounds. Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UGT2B4.

[25079] The function of UGT2B4 has been established by previous studies. The UDP- glucuronosyltransferases, a group of isoenzymes located primarily in hepatic endoplasmic

reticulum and nuclear envelope, are encoded by a large multigene family that has evolved to produce catalysts with differing but overlapping substrate specificities. Two subfamilies are recognized by sequence identities (Burchell et al., 1991). UGT1 consists of at least 4 isoenzymes that catalyze the glucuronidation of phenols and bilirubin. All 4 map to chromosome 2 and probably derive from the same gene (UGT1; 191740). The UGT2 family contains at least 5 members catalyzing steroid or bile acid glucuronidation. Members of the subfamily share 65 to 90% amino acid sequence identity. However, unlike the phenol UGT cDNAs, where the high degree of identity is concentrated in the 3- prime region of the cDNA, the steroid UGTs have a high degree of sequence homology throughout the cDNA. Riedy et al. (2000) examined a genomic map spanning approximately 500 to 1000 kb in the 4q13 region. They placed UGT2B4 between UGT2B7 and UGT2B15. Also, access to a large reference DNA bank allowed them to calculate the allele frequencies for a single nucleotide polymorphism (SNP), Q458D, in UGT2B4 among 803 unrelated individuals representing 5 ethnic populations. The findings suggested a recent evolutionary history of gene duplication, mutation, and rearrangement.

[25080]

[25081] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25082] Burchell, B.; Nebert, D. W.; Nelson, D. R.; Bock, K. W.; Iyanagi, T.; Jansen, P. L. M.; Lancet, T.; Mulder, G. J.; Chowdhury, J. R.; Siest, G.; Tephly, T. R.; Mackenzie, P. I. : The UDP- glucuronosyltransferase gene superfamily: suggested nomenclature based on evolutionary divergence. DNA Cell Biol. 10: 487- 494, 1991. ; and

[25083] Riedy, M.; Wang, J. Y.; Miller, A. P.; Buckler, A.; Hall, J.; Guida, M. : Genomic organization of the UGT2b gene cluster on human chromosome 4q13. Pharmacogenetics 10: 251- 260, 2000.

[25084] Further studies establishing the function and utilities of UGT2B4 are found in John Hopkins OMIM database record ID 600067, and in cited publications listed in Table 5, which are hereby incorporated by reference.X-prolyl aminopeptidase (aminopeptidase p) 2, membrane-bound (XPNPEP2, Accession NP_003390.2) is another GAM148 target gene, herein designated TARGET GENE. XPNPEP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by XPNPEP2, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of XPNPEP2 BINDING SITE, designated SEQ ID:966, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[25085] Another function of GAM148 is therefore inhibition of X-prolyl aminopeptidase (aminopeptidase p) 2, membrane-bound (XPNPEP2, Accession NP_003390.2), a gene which is a membrane- associated X- prolyl metallopeptidase . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XPNPEP2.

[25086] The function of XPNPEP2 has been established by previous studies. Aminopeptidase P is a widely distributed hydrolase that is specific for N- terminal imido bonds, which are common to several collagen degradation products, neuropeptides, vasoactive peptides, and cytokines. Structurally, the enzyme is a member of the 'pita bread fold' family and occurs in mammalian tissues in both soluble and GPI- anchored membrane- bound forms. By RT- PCR using degenerate oligonucleotides based on the pig aminopeptidase P amino acid sequence, and by 5- prime

and 3- prime RACE, Venema et al. (1997) isolated human kidney and lung cDNAs encoding XPNPEP2. The deduced XPNPEP2 protein has 673 amino acids and an estimated molecular mass of 75,490 Da. The authors stated that the human and pig XPNPEP2 amino acid sequences show significant evolutionary divergence, with 83% identity; 5 of 6 potential N- glycosylation sites, and 5 of 6 cysteine residues that are potentially involved in disulfide bond formation, are conserved. Northern blot analysis detected a 3.5- kb XPNPEP2 transcript in human kidney, lung, heart, placenta, liver, small intestine, and colon, but not in brain, skeletal muscle, pancreas, spleen, thymus, prostate, testis, ovary, or leukocytes. Based on these results and on RT- PCR studies, Venema et al. (1997) suggested that the membrane- bound form and the soluble form, which is found in brain and leukocytes, are the products of 2 different genes or of alternative splicing of a single primary transcript. Women with balanced translocations between the long arm of the X chromosome and an autosome frequently suffer premature ovarian failure (POF; 311360). Two critical regions for POF which extend from Xq13 to Xq22 and from Xq22 to Xq26 have been identified by cytogenetic studies. To gain insight into the mechanism(s)

responsible for ovarian failure in women with X/autosome translocations, Prueitt et al. (2000) molecularly characterized the translocation breakpoints of 9 X chromosomes. They mapped the breakpoints using somatic cell hybrids retaining the derivative autosome and densely spaced markers from the X- chromosome physical map. One of the POF- associated breakpoints in a critical region (Xq25) mapped to a sequenced PAC clone. The translocation disrupts XPNPEP2. XPNPEP2 mRNA was detected in fibroblasts that carried the translocation, suggesting that this gene at least partially escapes X inactivation. Although the physiologic substrates for the enzyme were not known, Prueitt et al. (2000) suggested that XPNPEP2 is a candidate gene for POF.

[25087]

[25088] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25089] Venema, R. C.; Ju, H.; Zou, R.; Venema, V. J.; Ryan, J. W. : Cloning and tissue distribution of human membrane-bound aminopeptidase P. Biochim. Biophys. Acta 1354: 45- 48, 1997. ; and

[25090] Prueitt, R. L.; Ross, J. L.; Zinn, A. R. : Physical mapping of

nine Xq translocation breakpoints and identification of XPNPEP2 as a premature ovarian failure candidate gene. Cytogenet.

[25091] Further studies establishing the function and utilities of XPNPEP2 are found in John Hopkins OMIM database record ID 300145, and in cited publications listed in Table 5, which are hereby incorporated by reference.Zinc finger protein 91 homolog (mouse) (ZFP91, Accession NP_739574.1) is another GAM148 target gene, herein designated TARGET GENE. ZFP91 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ZFP91, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZFP91 BINDING SITE, designated SEQ ID:15418, to the nucleotide sequence of GAM148 RNA, herein designated GAM RNA, also designated SEQ ID:280.

[25092] Another function of GAM148 is therefore inhibition of Zinc finger protein 91 homolog (mouse) (ZFP91, Accession NP_739574.1) . Accordingly, utilities of GAM148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP91.

[25093]

[25094] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 149 (GAM149), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25095] GAM149 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM149 was detected is described hereinabove with reference to Figs. 8-15.

[25096] GAM149 gene, herein designated GAM GENE, and GAM149 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[25097] GAM149 gene encodes a GAM149 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM149 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM149 precursor RNA is designated SEQ ID:146, and is provided hereinbelow with reference to the sequence listing part.

[25098] GAM149 precursor RNA folds onto itself, forming GAM149

folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25099] GAM149 precursor RNA folds onto itself, forming GAM149 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[25100] Nucleotide sequence of GAM149 precursor RNA, designated SEQ-ID: 146, and a schematic representation of a predicted secondary folding of GAM149 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[25101] An enzyme complex designated DICER COMPLEX, `dices`

the GAM149 folded precursor RNA into GAM149 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM149 RNA is designated SEQ ID:237, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[25102] GAM149 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM149 target RNA, herein designated GAM TARGET RNA. GAM149 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25103] GAM149 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM149 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM149

RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM149 RNA may have a different number of target binding sites in untranslated regions of a GAM149 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25104] The complementary binding of GAM149 RNA, herein designated GAM RNA, to target binding sites on GAM149 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM149 target RNA into GAM149 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25105] It is appreciated that GAM149 target gene, herein designated TARGET GENE, in fact represents a plurality of

GAM149 target genes. The mRNA of each one of this plurality of GAM149 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM149 RNA, herein designated GAM RNA, and which when bound by GAM149 RNA causes inhibition of translation of respective one or more GAM149 target proteins.

[25106] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM149 gene, herein designated GAM GENE, on one or more GAM149 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25107] It is appreciated that specific functions and accordingly utilities of GAM149 correlate with, and may be deduced from, the identity of the target genes which GAM149 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25108]

[25109]

[25110] Centaurin, gamma 1 (CENTG1, Accession NM_014770.1) is a GAM149 target gene, herein designated TARGET GENE. CENTG1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CENTG1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CENTG1 BINDING SITE, designated SEQ ID:18082, to the nucleotide sequence of GAM149 RNA, herein designated GAM RNA, also designated SEQ ID:237.

[25111] A function of GAM149 is therefore inhibition of Centaurin, gamma 1 (CENTG1, Accession NM_014770.1) . Accordingly, utilities of GAM149 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with CENTG1.

[25112] LCHN (Accession XM_098615.2) is another GAM149 target gene, herein designated TARGET GENE. LCHN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LCHN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LCHN BINDING SITE, designated SEQ ID:6008, to the nucleotide sequence of GAM149 RNA, herein designated GAM RNA, also designated SEQ ID:237.

[25113] Another function of GAM149 is therefore inhibition of LCHN (Accession XM_098615.2) . Accordingly, utilities of GAM149 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LCHN.

[25114] Leptin receptor overlapping transcript-like 1 (LEPROTL1, Accession NM_015344.1) is another GAM149 target gene, herein designated TARGET GENE. LEPROTL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LEPROTL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LEPROTL1

BINDING SITE, designated SEQ ID:8728, to the nucleotide sequence of GAM149 RNA, herein designated GAM RNA, also designated SEQ ID:237.

[25115] Another function of GAM149 is therefore inhibition of Leptin receptor overlapping transcript-like 1 (LEPROTL1, Accession NM_015344.1) . Accordingly, utilities of GAM149 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LEP-ROTL1.

[25116] LOC203286 (Accession) is another GAM149 target gene, herein designated TARGET GENE. LOC203286 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC203286, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC203286 BINDING SITE, designated SEQ ID:5131, to the nucleotide sequence of GAM149 RNA, herein designated GAM RNA, also designated SEQ ID:237.

[25117] Another function of GAM149 is therefore inhibition of LOC203286 (Accession) . Accordingly, utilities of GAM149 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC203286.

[25118]

[25119] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 150 (GAM150), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25120] GAM150 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM150 was detected is described hereinabove with reference to Figs. 8-15.

[25121] GAM150 gene, herein designated GAM GENE, and GAM150 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[25122] GAM150 gene encodes a GAM150 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM150 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM150 precursor RNA is designated SEQ ID:6, and is provided hereinbelow with reference to the sequence listing part.

[25123] GAM150 precursor RNA folds onto itself, forming GAM150 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25124] GAM150 precursor RNA folds onto itself, forming GAM150 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[25125] Nucleotide sequence of GAM150 precursor RNA, designated SEQ-ID: 6, and a schematic representation of a predicted secondary folding of GAM150 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[25126] An enzyme complex designated DICER COMPLEX, `dices` the GAM150 folded precursor RNA into GAM150 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM150 RNA is designated SEQ ID:261, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[25127] GAM150 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM150 target RNA, herein designated GAM TARGET RNA. GAM150 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25128] GAM150 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM150 target RNA, herein designated GAM TARGET RNA. This complementary binding is

due to the fact that the nucleotide sequence of GAM150 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM150 RNA may have a different number of target binding sites in untranslated regions of a GAM150 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25129] The complementary binding of GAM150 RNA, herein designated GAM RNA, to target binding sites on GAM150 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM150 target RNA into GAM150 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25130] It is appreciated that GAM150 target gene, herein desig-

nated TARGET GENE, in fact represents a plurality of GAM150 target genes. The mRNA of each one of this plurality of GAM150 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM150 RNA, herein designated GAM RNA, and which when bound by GAM150 RNA causes inhibition of translation of respective one or more GAM150 target proteins.

[25131] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM150 gene, herein designated GAM GENE, on one or more GAM150 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a

tiny RNA world, Science 294,779 (2001)).

[25132] It is appreciated that specific functions and accordingly utilities of GAM150 correlate with, and may be deduced from, the identity of the target genes which GAM150 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25133]

[25134]

[25135] Death-associated protein kinase 1 (DAPK1, Accession NM_004938.1) is a GAM150 target gene, herein designated TARGET GENE. DAPK1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DAPK1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DAPK1 BINDING SITE, designated SEQ ID:11771, to the nucleotide sequence of GAM150 RNA, herein designated GAM RNA, also designated SEQ ID:261.

[25136] A function of GAM150 is therefore inhibition of Death-associated protein kinase 1 (DAPK1, Accession NM_004938.1) . Accordingly, utilities of GAM150 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with DAPK1.

[25137] LOC128008 (Accession) is another GAM150 target gene, herein designated TARGET GENE. LOC128008 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC128008, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC128008 BINDING SITE, designated SEQ ID:16098, to the nucleotide sequence of GAM150 RNA, herein designated GAM RNA, also designated SEQ ID:261.

[25138] Another function of GAM150 is therefore inhibition of LOC128008 (Accession) . Accordingly, utilities of GAM150 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128008.

[25139] LOC221399 (Accession XM_168134.1) is another GAM150 target gene, herein designated TARGET GENE. LOC221399 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC221399, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC221399 BINDING SITE, designated SEQ ID:14194, to the nucleotide sequence of GAM150 RNA, herein designated GAM RNA, also designated SEQ ID:261.

[25140] Another function of GAM150 is therefore inhibition of LOC221399 (Accession XM_168134.1) . Accordingly, utilities of GAM150 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221399.

[25141] LOC253216 (Accession XM_170765.2) is another GAM150 target gene, herein designated TARGET GENE. LOC253216 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC253216, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC253216 BINDING SITE, designated SEQ ID:10298, to the nucleotide sequence of GAM150 RNA, herein designated GAM RNA, also designated SEQ ID:261.

[25142] Another function of GAM150 is therefore inhibition of LOC253216 (Accession XM_170765.2) . Accordingly, utilities of GAM150 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC253216.

[25143] Solute carrier family 2 (facilitated glucose transporter), member 10 (SLC2A10, Accession NM_030777.2) is another GAM150 target gene, herein designated TARGET GENE. SLC2A10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC2A10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC2A10 BINDING SITE, designated SEQ ID:1592, to the nucleotide sequence of GAM150 RNA, herein designated GAM RNA, also designated SEQ ID:261.

[25144] Another function of GAM150 is therefore inhibition of Solute carrier family 2 (facilitated glucose transporter), member 10 (SLC2A10, Accession NM_030777.2) . Accordingly, utilities of GAM150 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC2A10.

[25145]

[25146] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 151 (GAM151), which modulates expression of respective tar-

get genes thereof, the function and utility of which target genes is known in the art.

[25147] GAM151 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM151 was detected is described hereinabove with reference to Figs. 8-15.

[25148] GAM151 gene, herein designated GAM GENE, and GAM151 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[25149] GAM151 gene encodes a GAM151 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM151 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM151 precursor RNA is designated SEQ ID:71, and is provided hereinbelow with reference to the sequence listing part.

[25150] GAM151 precursor RNA folds onto itself, forming GAM151 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25151] GAM151 precursor RNA folds onto itself, forming GAM151 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[25152] Nucleotide sequence of GAM151 precursor RNA, designated SEQ-ID: 71, and a schematic representation of a predicted secondary folding of GAM151 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[25153] An enzyme complex designated DICER COMPLEX, `dices` the GAM151 folded precursor RNA into GAM151 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM151 RNA is designated SEQ ID:205, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[25154] GAM151 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM151 target RNA, herein designated GAM TARGET RNA. GAM151 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25155] GAM151 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM151 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM151 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated

that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM151 RNA may have a different number of target binding sites in untranslated regions of a GAM151 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25156] The complementary binding of GAM151 RNA, herein designated GAM RNA, to target binding sites on GAM151 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM151 target RNA into GAM151 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25157] It is appreciated that GAM151 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM151 target genes. The mRNA of each one of this plurality of GAM151 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM151 RNA, herein designated GAM RNA, and which when bound by

GAM151 RNA causes inhibition of translation of respective one or more GAM151 target proteins.

[25158] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM151 gene, herein designated GAM GENE, on one or more GAM151 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25159] It is appreciated that specific functions and accordingly utilities of GAM151 correlate with, and may be deduced from, the identity of the target genes which GAM151 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25160]

[25161]

[25162] LOC151816 (Accession) is a GAM151 target gene, herein designated TARGET GENE. LOC151816 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC151816, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151816 BINDING SITE, designated SEQ ID:12621, to the nucleotide sequence of GAM151 RNA, herein designated GAM RNA, also designated SEQ ID:205.

[25163] A function of GAM151 is therefore inhibition of LOC151816 (Accession) . Accordingly, utilities of GAM151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151816.

[25164]

[25165] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 152 (GAM152), which modulates expression of respective tar-

get genes thereof, the function and utility of which target genes is known in the art.

[25166] GAM152 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM152 was detected is described hereinabove with reference to Figs. 8-15.

[25167] GAM152 gene, herein designated GAM GENE, and GAM152 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[25168] GAM152 gene encodes a GAM152 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM152 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM152 precursor RNA is designated SEQ ID:52, and is provided hereinbelow with reference to the sequence listing part.

[25169] GAM152 precursor RNA folds onto itself, forming GAM152 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25170] GAM152 precursor RNA folds onto itself, forming GAM152 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[25171] Nucleotide sequence of GAM152 precursor RNA, designated SEQ-ID: 52, and a schematic representation of a predicted secondary folding of GAM152 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[25172] An enzyme complex designated DICER COMPLEX, `dices` the GAM152 folded precursor RNA into GAM152 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM152 RNA is designated SEQ ID:378, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[25173] GAM152 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM152 target RNA, herein designated GAM TARGET RNA. GAM152 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25174] GAM152 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM152 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM152 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated

that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM152 RNA may have a different number of target binding sites in untranslated regions of a GAM152 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25175] The complementary binding of GAM152 RNA, herein designated GAM RNA, to target binding sites on GAM152 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM152 target RNA into GAM152 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25176] It is appreciated that GAM152 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM152 target genes. The mRNA of each one of this plurality of GAM152 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM152 RNA, herein designated GAM RNA, and which when bound by

GAM152 RNA causes inhibition of translation of respective one or more GAM152 target proteins.

[25177] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM152 gene, herein designated GAM GENE, on one or more GAM152 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25178] It is appreciated that specific functions and accordingly utilities of GAM152 correlate with, and may be deduced from, the identity of the target genes which GAM152 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25179]

[25180]

[25181] Annexin a7 (ANXA7, Accession NM_001156.2) is a GAM152 target gene, herein designated TARGET GENE. ANXA7 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ANXA7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ANXA7 BINDING SITE, designated SEQ ID:7738, to the nucleotide sequence of GAM152 RNA, herein designated GAM RNA, also designated SEQ ID:378.

[25182] A function of GAM152 is therefore inhibition of Annexin a7 (ANXA7, Accession NM_001156.2), a gene which promotes membrane fusion and is involved in exocytosis. and therefore may be associated with Prostate cancer. Accordingly, utilities of GAM152 include diagnosis, prevention and treatment of Prostate cancer, and of other diseases and clinical conditions associated with ANXA7.

[25183] The function of ANXA7 has been established by previous studies. The ANX7 gene is located on chromosome 10q21, a site long hypothesized to harbor a tumor sup-

pressor gene or genes associated with prostate and other cancers. To test this hypothesis, Srivastava et al. (2001) analyzed the action of the ANX7 gene on colony formation by human tumor cell lines. They also examined the expression of the ANX7 protein in a large number of prostate cancers using tumor tissue microarray technology. Finally, they tested a panel of primary and metastatic prostate cancers for evidence of loss of heterozygosity (LOH). They found that human tumor cell proliferation and colony formation were markedly reduced when the wild-type ANX7 gene was transfected into 2 prostate tumor cell lines. Consistently, analysis of ANX7 protein expression in human prostate tumor microarrays revealed a significantly higher rate of loss of ANX7 expression in metastatic and local recurrences of hormone refractory prostate cancer as compared with primary tumors ($P = 0.0001$). Using 4 microsatellite markers at or near the ANX7 locus and laser capture microdissected tumor cells, 35% of 20 primary prostate tumors showed LOH. The microsatellite marker closest to the ANX7 locus showed the highest rate of LOH, including 1 homozygous deletion. Srivastava et al. (2001) concluded that the ANX7 gene exhibits many biologic and genetic properties expected of a tumor suppressor gene

and may play a role in prostate cancer progression.

[25184] Animal model experiments lend further support to the function of ANXA7. By gene targeting, Srivastava et al. (1999) developed Anxa7- null mice. The null phenotype was lethal at embryonic day 10. Heterozygous mice were viable and fertile, but showed a defect in insulin secretion and an increased insulin content within isolated pancreatic islets. Electrooptical recordings suggested that the mutation altered Ca(2+) release by agonists of inositol trisphosphate. Using mice with a different genetic background and an alternate strategy to introduce the null mutation, Herr et al. (2001) developed Anxa7 - /- mice that were viable, fertile, and showed no obvious defects. Analysis of insulin secretion from isolated islets revealed no evidence for the involvement of Anxa7 in Ca(2+)- dependent or cAMP- mediated exocytosis. In cardiomyocytes, however, they found a functional role for Anxa7 in electromechanical coupling. Cardiomyocytes from embryonic Anxa7- null mice displayed intact Ca(2+) homeostasis and unremarkable excitation- contraction coupling; however, adult Anxa7 - /- mice exhibited a decrease in frequency- induced cell shortening.

[25185] It is appreciated that the abovementioned animal model

for ANXA7 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[25186] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25187] Srivastava, M.; Atwater, I.; Glasman, M.; Leighton, X.; Goping, G.; Caohuy, H.; Miller, G.; Pichel, J.; Westphal, H.; Mears, D.; Rojas, E.; Pollard, H. B. : Defects in inositol 1,4,5- trisphosphate receptor expression, Ca(2+) signaling, and insulin secretion in the anx7(+/-) knockout mouse. Proc. Nat. Acad. Sci. 96: 13783- 13788, 1999. ; and

[25188] Srivastava, M.; Bubendorf, L.; Srikantan, V.; Fossom, L.; Nolan, L.; Glasman, M.; Leighton, X.; Fehrle, W.; Pittaluga, S.; Raffeld, M.; Koivisto, P.; Willi, N.; Gasser, T. C.; Kononen.

[25189] Further studies establishing the function and utilities of ANXA7 are found in John Hopkins OMIM database record ID 186360, and in cited publications listed in Table 5, which are hereby incorporated by reference.Calsenilin, presenilin binding protein, ef hand transcription factor (CSEN, Accession NM_013434.3) is another GAM152 tar-

get gene, herein designated TARGET GENE. CSEN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CSEN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CSEN BINDING SITE, designated SEQ ID:13661, to the nucleotide sequence of GAM152 RNA, herein designated GAM RNA, also designated SEQ ID:378.

[25190] Another function of GAM152 is therefore inhibition of Calsenilin, presenilin binding protein, ef hand transcription factor (CSEN, Accession NM_013434.3) . Accordingly, utilities of GAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSEN.

[25191] Neuroligin 1 (NLGN1, Accession NM_014932.1) is another GAM152 target gene, herein designated TARGET GENE. NLGN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NLGN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NLGN1 BINDING SITE, designated SEQ ID:6771, to the

nucleotide sequence of GAM152 RNA, herein designated GAM RNA, also designated SEQ ID:378.

[25192] Another function of GAM152 is therefore inhibition of Neuroligin 1 (NLGN1, Accession NM_014932.1), a gene which may trigger the de novo formation of presynaptic structure. Accordingly, utilities of GAM152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NLGN1.

[25193] The function of NLGN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM90.1.

[25194] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 153 (GAM153), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25195] GAM153 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM153 was detected is described hereinabove with reference to Figs. 8-15.

[25196] GAM153 gene, herein designated GAM GENE, and

GAM153 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[25197] GAM153 gene encodes a GAM153 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM153 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM153 precursor RNA is designated SEQ ID:186, and is provided hereinbelow with reference to the sequence listing part.

[25198] GAM153 precursor RNA folds onto itself, forming GAM153 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25199] GAM153 precursor RNA folds onto itself, forming GAM153 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin struc-

ture`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[25200] Nucleotide sequence of GAM153 precursor RNA, designated SEQ-ID: 186, and a schematic representation of a predicted secondary folding of GAM153 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[25201] An enzyme complex designated DICER COMPLEX, `dices` the GAM153 folded precursor RNA into GAM153 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM153 RNA is designated SEQ ID:244, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[25202] GAM153 target gene, herein designated TARGET GENE,

encodes a corresponding messenger RNA, GAM153 target RNA, herein designated GAM TARGET RNA. GAM153 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25203] GAM153 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM153 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM153 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM153 RNA may have a different number of target binding sites in untranslated regions of a GAM153 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25204] The complementary binding of GAM153 RNA, herein designated GAM RNA, to target binding sites on GAM153 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM153 target RNA into GAM153 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25205] It is appreciated that GAM153 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM153 target genes. The mRNA of each one of this plurality of GAM153 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM153 RNA, herein designated GAM RNA, and which when bound by GAM153 RNA causes inhibition of translation of respective one or more GAM153 target proteins.

[25206] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM153 gene, herein designated GAM GENE, on one or more GAM153 target genes, herein collectively designated

TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25207] It is appreciated that specific functions and accordingly utilities of GAM153 correlate with, and may be deduced from, the identity of the target genes which GAM153 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25208]

[25209]

[25210] Dna-damage-inducible transcript 3 (DDIT3, Accession NM_004083.2) is a GAM153 target gene, herein designated TARGET GENE. DDIT3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA en-

coded by DDIT3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DDIT3 BINDING SITE, designated SEQ ID:6855, to the nucleotide sequence of GAM153 RNA, herein designated GAM RNA, also designated SEQ ID:244.

[25211] A function of GAM153 is therefore inhibition of Dna-damage-inducible transcript 3 (DDIT3, Accession NM_004083.2), a gene which May be a transcription factor and inhibits the DNA- binding activity of C/EBP and LAP and therefore may be associated with Myxoid liposarcoma . Accordingly, utilities of GAM153 include diagnosis, prevention and treatment of Myxoid liposarcoma ., and of other diseases and clinical conditions associated with DDIT3.

[25212] The function of DDIT3 has been established by previous studies. CHOP is consistently rearranged in myxoid liposarcomas (Aman et al., 1992). In the characteristic chromosomal translocation t(12;16)(q13;p11), Crozat et al. (1993) showed that the CHOP gene is fused with a gene on chromosome 16 provisionally designated TLS (for 'translocated in liposarcoma'). The same gene was called FUS by Rabbitts et al. (1993); see 137070. The TLS gene

was found to be a novel nuclear RNA- binding protein with extensive sequence similarity to EWS (OMIM Ref. No. 133450), the product of a gene commonly translocated in Ewing sarcoma. In TLS- CHOP, the RNA- binding domain of TLS is replaced by the DNA- binding and leucine zipper dimerization domain of CHOP. Targeting of a conserved effector domain of RNA- binding proteins to DNA may play a role in tumor formation. In an analysis of peripheral blood samples from 19 patients with myxoid liposarcoma due to t(12;16) and in 1 patient with myxoid liposarcoma due to t(12;22;20), resulting in the fusion of the CHOP and EWS genes, Panagopoulos et al. (1996) found FUS/ CHOP hybrid fragments in 3 patients with t(12;16) and a EWS/CHOP hybrid in the patient with the latter translocation.

[25213]

[25214] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25215] Crozat, A.; Aman, P.; Mandahl, N.; Ron, D. : Fusion of CHOP to a novel RNA- binding protein in human myxoid liposarcoma. Nature 363: 640- 644, 1993. ; and

[25216] Panagopoulos, I.; Aman, P.; Mertens, F.; Mandahl, N.; Ryd-

holm, A.; Bauer, H. F. C.; Mitelman, F. : Genomic PCR detects tumor cells in peripheral blood from patients with myxoid liposarco.

[25217] Further studies establishing the function and utilities of DDIT3 are found in John Hopkins OMIM database record ID 126337, and in cited publications listed in Table 5, which are hereby incorporated by reference.

[25218] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 154 (GAM154), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25219] GAM154 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM154 was detected is described hereinabove with reference to Figs. 8-15.

[25220] GAM154 gene, herein designated GAM GENE, and GAM154 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[25221] GAM154 gene encodes a GAM154 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM154 precur-

sor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM154 precursor RNA is designated SEQ ID:176, and is provided hereinbelow with reference to the sequence listing part.

[25222] GAM154 precursor RNA folds onto itself, forming GAM154 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25223] GAM154 precursor RNA folds onto itself, forming GAM154 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[25224] Nucleotide sequence of GAM154 precursor RNA, designated SEQ-ID: 176, and a schematic representation of a predicted secondary folding of GAM154 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[25225] An enzyme complex designated DICER COMPLEX, `dices` the GAM154 folded precursor RNA into GAM154 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM154 RNA is designated SEQ ID:228, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[25226] GAM154 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM154 target RNA, herein designated GAM TARGET RNA. GAM154 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[25227] GAM154 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM154 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM154 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM154 RNA may have a different number of target binding sites in untranslated regions of a GAM154 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25228] The complementary binding of GAM154 RNA, herein designated GAM RNA, to target binding sites on GAM154 target RNA, herein designated GAM TARGET RNA, such as

BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM154 target RNA into GAM154 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25229] It is appreciated that GAM154 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM154 target genes. The mRNA of each one of this plurality of GAM154 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM154 RNA, herein designated GAM RNA, and which when bound by GAM154 RNA causes inhibition of translation of respective one or more GAM154 target proteins.

[25230] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM154 gene, herein designated GAM GENE, on one or more GAM154 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other

recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25231] It is appreciated that specific functions and accordingly utilities of GAM154 correlate with, and may be deduced from, the identity of the target genes which GAM154 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25232]

[25233]

[25234] HSZFP36 (Accession XM_290868.1) is a GAM154 target gene, herein designated TARGET GENE. HSZFP36 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HSZFP36, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HSZFP36 BINDING SITE, designated SEQ ID:3168, to the nucleotide sequence of GAM154 RNA, herein designated GAM RNA,

also designated SEQ ID:228.

[25235] A function of GAM154 is therefore inhibition of HSZFP36 (Accession XM_290868.1) . Accordingly, utilities of GAM154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSZFP36.

[25236] LOC257541 (Accession) is another GAM154 target gene, herein designated TARGET GENE. LOC257541 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC257541, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC257541 BINDING SITE, designated SEQ ID:9823, to the nucleotide sequence of GAM154 RNA, herein designated GAM RNA, also designated SEQ ID:228.

[25237] Another function of GAM154 is therefore inhibition of LOC257541 (Accession) . Accordingly, utilities of GAM154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257541.

[25238]

[25239] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, re-

ferred to here as Genomic Address Messenger 155 (GAM155), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25240] GAM155 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM155 was detected is described hereinabove with reference to Figs. 8-15.

[25241] GAM155 gene, herein designated GAM GENE, and GAM155 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[25242] GAM155 gene encodes a GAM155 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM155 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM155 precursor RNA is designated SEQ ID:26, and is provided hereinbelow with reference to the sequence listing part.

[25243] GAM155 precursor RNA folds onto itself, forming GAM155 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin struc-

ture`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25244] GAM155 precursor RNA folds onto itself, forming GAM155 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[25245] Nucleotide sequence of GAM155 precursor RNA, designated SEQ-ID: 26, and a schematic representation of a predicted secondary folding of GAM155 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[25246] An enzyme complex designated DICER COMPLEX, `dices` the GAM155 folded precursor RNA into GAM155 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM155 RNA is designated SEQ ID:207, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[25247] GAM155 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM155 target RNA, herein designated GAM TARGET RNA. GAM155 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25248] GAM155 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM155 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM155 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such

target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM155 RNA may have a different number of target binding sites in untranslated regions of a GAM155 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25249] The complementary binding of GAM155 RNA, herein designated GAM RNA, to target binding sites on GAM155 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM155 target RNA into GAM155 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25250] It is appreciated that GAM155 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM155 target genes. The mRNA of each one of this plurality of GAM155 target genes comprises one or more target binding sites, each having a nucleotide sequence

which is at least partly complementary to GAM155 RNA, herein designated GAM RNA, and which when bound by GAM155 RNA causes inhibition of translation of respective one or more GAM155 target proteins.

[25251] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM155 gene, herein designated GAM GENE, on one or more GAM155 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25252] It is appreciated that specific functions and accordingly utilities of GAM155 correlate with, and may be deduced from, the identity of the target genes which GAM155

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25253]

[25254]

[25255] DKFZp761O17121 (Accession) is a GAM155 target gene, herein designated TARGET GENE. DKFZp761O17121 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp761O17121, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761O17121 BINDING SITE, designated SEQ ID:18570, to the nucleotide sequence of GAM155 RNA, herein designated GAM RNA, also designated SEQ ID:207.

[25256] A function of GAM155 is therefore inhibition of DKFZp761O17121 (Accession) . Accordingly, utilities of GAM155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761O17121.

[25257] KIAA0564 (Accession XM_038664.6) is another GAM155 target gene, herein designated TARGET GENE. KIAA0564

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0564, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0564 BINDING SITE, designated SEQ ID:18220, to the nucleotide sequence of GAM155 RNA, herein designated GAM RNA, also designated SEQ ID:207.

[25258] Another function of GAM155 is therefore inhibition of KIAA0564 (Accession XM_038664.6) . Accordingly, utilities of GAM155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0564.

[25259] LOC152941 (Accession) is another GAM155 target gene, herein designated TARGET GENE. LOC152941 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC152941, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152941 BINDING SITE, designated SEQ ID:8587, to the nucleotide sequence of GAM155 RNA, herein designated GAM RNA, also designated SEQ ID:207.

[25260] Another function of GAM155 is therefore inhibition of LOC152941 (Accession) . Accordingly, utilities of GAM155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152941.

[25261] Prostaglandin-endoperoxide synthase 1 (prostaglandin g/h synthase and cyclooxygenase) (PTGS1, Accession NM_000962.2) is another GAM155 target gene, herein designated TARGET GENE. PTGS1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PTGS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTGS1 BINDING SITE, designated SEQ ID:19654, to the nucleotide sequence of GAM155 RNA, herein designated GAM RNA, also designated SEQ ID:207.

[25262] Another function of GAM155 is therefore inhibition of Prostaglandin-endoperoxide synthase 1 (prostaglandin g/h synthase and cyclooxygenase) (PTGS1, Accession NM_000962.2), a gene which may play an important role in regulating or promoting cell proliferation in some normal and neoplastically transformed cells. Accordingly,

utilities of GAM155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGS1.

[25263] The function of PTGS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.

[25264] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 156 (GAM156), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25265] GAM156 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM156 was detected is described hereinabove with reference to Figs. 8-15.

[25266] GAM156 gene, herein designated GAM GENE, and GAM156 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[25267] GAM156 gene encodes a GAM156 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM156 precur-

sor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM156 precursor RNA is designated SEQ ID:54, and is provided hereinbelow with reference to the sequence listing part.

[25268] GAM156 precursor RNA folds onto itself, forming GAM156 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25269] GAM156 precursor RNA folds onto itself, forming GAM156 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[25270] Nucleotide sequence of GAM156 precursor RNA, designated SEQ-ID: 54, and a schematic representation of a predicted secondary folding of GAM156 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[25271] An enzyme complex designated DICER COMPLEX, `dices` the GAM156 folded precursor RNA into GAM156 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM156 RNA is designated SEQ ID:262, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[25272] GAM156 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM156 target RNA, herein designated GAM TARGET RNA. GAM156 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[25273] GAM156 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM156 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM156 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM156 RNA may have a different number of target binding sites in untranslated regions of a GAM156 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25274] The complementary binding of GAM156 RNA, herein designated GAM RNA, to target binding sites on GAM156 target RNA, herein designated GAM TARGET RNA, such as

BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM156 target RNA into GAM156 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25275] It is appreciated that GAM156 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM156 target genes. The mRNA of each one of this plurality of GAM156 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM156 RNA, herein designated GAM RNA, and which when bound by GAM156 RNA causes inhibition of translation of respective one or more GAM156 target proteins.

[25276] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM156 gene, herein designated GAM GENE, on one or more GAM156 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other

recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25277] It is appreciated that specific functions and accordingly utilities of GAM156 correlate with, and may be deduced from, the identity of the target genes which GAM156 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25278]

[25279]

[25280] Clathrin, heavy polypeptide-like 1 (CLTCL1, Accession NM_001835.1) is a GAM156 target gene, herein designated TARGET GENE. CLTCL1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CLTCL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLTCL1 BINDING SITE, designated SEQ ID:6732, to the nu-

cleotide sequence of GAM156 RNA, herein designated GAM RNA, also designated SEQ ID:262.

[25281] A function of GAM156 is therefore inhibition of Clathrin, heavy polypeptide-like 1 (CLTCL1, Accession NM_001835.1), a gene which is involved in vesicle budding. and therefore may be associated with The velocardiofacial syndrome. Accordingly, utilities of GAM156 include diagnosis, prevention and treatment of The velocardiofacial syndrome, and of other diseases and clinical conditions associated with CLTCL1.

[25282] The function of CLTCL1 has been established by previous studies. Clathrin is the main structural component of the lattice covering the cytoplasmic face of the coated pits and coated vesicles in which specific macromolecules are entrapped in the process of receptor- mediated endocytosis. Clathrin is a large, soluble protein composed of heavy chains (molecular size, about 192 kD) and light chains (molecular size, about 32- 38 kD). Two major classes of clathrin light chains, referred to as LCA and LCB, have been identified. (The gene is also symbolized CLTA.) The structure of these light chains was studied by Kirchhausen et al. (1987). The clathrin unit that assembles into coats had 3 extended legs, 500 angstroms in length,

splayed out in a pinwheel- like structure (triskelion). Each of the legs is built from a single heavy chain, with a light chain bound to each proximal segment. At least 4 distinct forms of clathrin light chains are found in mammalian cells. This molecular variability derives from tissue- specific patterns of expression of LCA and LCB genes (Jackson et al., 1987). Brodsky et al. (1987) identified that part of the light- chain sequence that mediates heavy- chain binding and is the region of strongest homology with intermediate filament proteins. Sequence analysis shows an overall homology of 60% between LCA and LCB and the presence of brain- specific insertion sequences. LCA and LCB (OMIM Ref. No. 118970) are coded by distinct genes. Jackson and Parham (1988) compared cDNAs encoding the brain and nonbrain forms of human LCA and LCB with their homologs in cow and rat. The significant differences that distinguish LCA from LCB and the brain from the nonbrain forms show remarkable preservation in all 3 species. Each clathrin triskelion consists of 3 heavy chains and 3 light chains. In the brain, tissue- specific mRNA splicing yields larger forms of LCA and LCB, containing additional insertion sequences of 30 and 18 amino acids, respectively By Southern blot analysis on genomic DNA

extracted from a panel of mouse- human somatic cell hybrids and by isotopic in situ hybridization, Ponnambalam et al. (1994) assigned the CLTA gene to human 12q23-q24

[25283]

[25284] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25285] Sirotkin, H.; Morrow, B.; DasGupta, R.; Goldberg, R.; Patanjali, S. R.; Shi, G.; Cannizzaro, L.; Shprintzen, R.; Weissman, S. M.; Kucherlapati, R. : Isolation of a new clathrin heavy chain gene with muscle- specific expression from the region commonly deleted in velo- cardio-facial syndrome. Hum. Molec. Genet. 5: 617- 624, 1996. ; and

[25286] Long, K. R.; Trofatter, J. A.; Ramesh, V.; McCormick, M. K.; Buckler, A. J. : Cloning and characterization of a novel human clathrin heavy chain gene (CLTCL). Genomics 35: 466- 472, 1996.

[25287] Further studies establishing the function and utilities of CLTCL1 are found in John Hopkins OMIM database record ID 601273, and in cited publications listed in Table 5, which are hereby incorporated by reference.Dishevelled

associated activator of morphogenesis 2 (DAAM2, Accession XM_166434.3) is another GAM156 target gene, herein designated TARGET GENE. DAAM2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DAAM2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:4578, to the nucleotide sequence of GAM156 RNA, herein designated GAM RNA, also designated SEQ ID:262.

[25288] Another function of GAM156 is therefore inhibition of Dishevelled associated activator of morphogenesis 2 (DAAM2, Accession XM_166434.3), a gene which controls cell polarity and movement during development. Accordingly, utilities of GAM156 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2.

[25289] The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.DKFZP434P0111 (Accession XM_041116.4) is another GAM156 target gene, herein designated TARGET

GENE. DKFZP434P0111 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP434P0111, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434P0111 BINDING SITE, designated SEQ ID:16713, to the nucleotide sequence of GAM156 RNA, herein designated GAM RNA, also designated SEQ ID:262.

[25290] Another function of GAM156 is therefore inhibition of DKFZP434P0111 (Accession XM_041116.4) . Accordingly, utilities of GAM156 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P0111.

[25291] FLJ10759 (Accession NM_018207.1) is another GAM156 target gene, herein designated TARGET GENE. FLJ10759 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10759, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10759 BINDING SITE, designated SEQ ID:6060, to the nucleotide sequence of GAM156 RNA, herein designated

GAM RNA, also designated SEQ ID:262.

[25292] Another function of GAM156 is therefore inhibition of FLJ10759 (Accession NM_018207.1) . Accordingly, utilities of GAM156 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10759.

[25293] KIAA0802 (Accession XM_031357.4) is another GAM156 target gene, herein designated TARGET GENE. KIAA0802 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0802, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0802 BINDING SITE, designated SEQ ID:15745, to the nucleotide sequence of GAM156 RNA, herein designated GAM RNA, also designated SEQ ID:262.

[25294] Another function of GAM156 is therefore inhibition of KIAA0802 (Accession XM_031357.4) . Accordingly, utilities of GAM156 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0802.

[25295] LOC148894 (Accession XM_097542.2) is another GAM156 target gene, herein designated TARGET GENE. LOC148894

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC148894, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148894 BINDING SITE, designated SEQ ID:8056, to the nucleotide sequence of GAM156 RNA, herein designated GAM RNA, also designated SEQ ID:262.

[25296] Another function of GAM156 is therefore inhibition of LOC148894 (Accession XM_097542.2) . Accordingly, utilities of GAM156 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148894.

[25297] LOC199988 (Accession XM_117166.1) is another GAM156 target gene, herein designated TARGET GENE. LOC199988 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC199988, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC199988 BINDING SITE, designated SEQ ID:3088, to the nucleotide sequence of GAM156 RNA, herein designated GAM RNA, also designated SEQ ID:262.

[25298] Another function of GAM156 is therefore inhibition of LOC199988 (Accession XM_117166.1) . Accordingly, utilities of GAM156 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199988.

[25299] Signal-regulatory protein beta 1 (SIRPB1, Accession NM_006065.1) is another GAM156 target gene, herein designated TARGET GENE. SIRPB1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SIRPB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIRPB1 BINDING SITE, designated SEQ ID:16696, to the nucleotide sequence of GAM156 RNA, herein designated GAM RNA, also designated SEQ ID:262.

[25300] Another function of GAM156 is therefore inhibition of Signal-regulatory protein beta 1 (SIRPB1, Accession NM_006065.1) . Accordingly, utilities of GAM156 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIRPB1.

[25301] Tripartite motif-containing 37 (TRIM37, Accession NM_015294.1) is another GAM156 target gene, herein

designated TARGET GENE. TRIM37 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TRIM37, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRIM37 BINDING SITE, designated SEQ ID:19960, to the nucleotide sequence of GAM156 RNA, herein designated GAM RNA, also designated SEQ ID:262.

[25302] Another function of GAM156 is therefore inhibition of Tripartite motif-containing 37 (TRIM37, Accession NM_015294.1) . Accordingly, utilities of GAM156 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM37.

[25303]

[25304] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 157 (GAM157), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25305] GAM157 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method

by which GAM157 was detected is described hereinabove with reference to Figs. 8-15.

[25306] GAM157 gene, herein designated GAM GENE, and GAM157 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[25307] GAM157 gene encodes a GAM157 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM157 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM157 precursor RNA is designated SEQ ID:193, and is provided hereinbelow with reference to the sequence listing part.

[25308] GAM157 precursor RNA folds onto itself, forming GAM157 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25309] GAM157 precursor RNA folds onto itself, forming GAM157

folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[25310] Nucleotide sequence of GAM157 precursor RNA, designated SEQ-ID: 193, and a schematic representation of a predicted secondary folding of GAM157 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[25311] An enzyme complex designated DICER COMPLEX, `dices` the GAM157 folded precursor RNA into GAM157 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM157 RNA is designated SEQ ID:225, and is provided hereinbelow with refer-

ences to the sequence listing part and Table 3, hereby incorporated by reference.

[25312] GAM157 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM157 target RNA, herein designated GAM TARGET RNA. GAM157 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25313] GAM157 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM157 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM157 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM157 RNA may have a different number of target binding sites in untranslated regions of a GAM157 target

RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25314] The complementary binding of GAM157 RNA, herein designated GAM RNA, to target binding sites on GAM157 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM157 target RNA into GAM157 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25315] It is appreciated that GAM157 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM157 target genes. The mRNA of each one of this plurality of GAM157 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM157 RNA, herein designated GAM RNA, and which when bound by GAM157 RNA causes inhibition of translation of respective one or more GAM157 target proteins.

[25316] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with

specific reference to translational inhibition exerted by GAM157 gene, herein designated GAM GENE, on one or more GAM157 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25317] It is appreciated that specific functions and accordingly utilities of GAM157 correlate with, and may be deduced from, the identity of the target genes which GAM157 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25318]

[25319]

[25320] Angiomotin (AMOT, Accession NM_133265.1) is a

GAM157 target gene, herein designated TARGET GENE. AMOT BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AMOT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AMOT BINDING SITE, designated SEQ ID:1662, to the nucleotide sequence of GAM157 RNA, herein designated GAM RNA, also designated SEQ ID:225.

[25321] A function of GAM157 is therefore inhibition of Angiomotin (AMOT, Accession NM_133265.1) . Accordingly, utilities of GAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMOT.

[25322] Chromatin assembly factor 1, subunit b (p60) (CHAF1B, Accession NM_005441.1) is another GAM157 target gene, herein designated TARGET GENE. CHAF1B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CHAF1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHAF1B BINDING SITE, designated SEQ ID:17720, to the nucleotide se-

quence of GAM157 RNA, herein designated GAM RNA, also designated SEQ ID:225.

[25323] Another function of GAM157 is therefore inhibition of Chromatin assembly factor 1, subunit b (p60) (CHAF1B, Accession NM_005441.1) . Accordingly, utilities of GAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHAF1B.

[25324] D123 (Accession) is another GAM157 target gene, herein designated TARGET GENE. D123 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by D123, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of D123 BINDING SITE, designated SEQ ID:2735, to the nucleotide sequence of GAM157 RNA, herein designated GAM RNA, also designated SEQ ID:225.

[25325] Another function of GAM157 is therefore inhibition of D123 (Accession) . Accordingly, utilities of GAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with D123.

[25326] LOC149935 (Accession) is another GAM157 target gene, herein designated TARGET GENE. LOC149935 BINDING SITE is a target binding site found in the 3` untranslated

region of mRNA encoded by LOC149935, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149935 BINDING SITE, designated SEQ ID:1436, to the nucleotide sequence of GAM157 RNA, herein designated GAM RNA, also designated SEQ ID:225.

[25327] Another function of GAM157 is therefore inhibition of LOC149935 (Accession) . Accordingly, utilities of GAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149935.

[25328] LOC221491 (Accession XM_166344.3) is another GAM157 target gene, herein designated TARGET GENE. LOC221491 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC221491, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221491 BINDING SITE, designated SEQ ID:9737, to the nucleotide sequence of GAM157 RNA, herein designated GAM RNA, also designated SEQ ID:225.

[25329] Another function of GAM157 is therefore inhibition of

LOC221491 (Accession XM_166344.3) . Accordingly, utilities of GAM157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221491.

[25330]

[25331] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 158 (GAM158), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25332] GAM158 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM158 was detected is described hereinabove with reference to Figs. 8-15.

[25333] GAM158 gene, herein designated GAM GENE, and GAM158 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[25334] GAM158 gene encodes a GAM158 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM158 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of

GAM158 precursor RNA is designated SEQ ID:47, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:47 is located at position 112174058 relative to chromosome 1.

[25335] GAM158 precursor RNA folds onto itself, forming GAM158 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25336] GAM158 precursor RNA folds onto itself, forming GAM158 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[25337] Nucleotide sequence of GAM158 precursor RNA, desig-

nated SEQ-ID: 47, and a schematic representation of a predicted secondary folding of GAM158 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[25338] An enzyme complex designated DICER COMPLEX, `dices` the GAM158 folded precursor RNA into GAM158 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM158 RNA is designated SEQ ID:383, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[25339] GAM158 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM158 target RNA, herein designated GAM TARGET RNA. GAM158 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25340] GAM158 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM158 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM158 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM158 RNA may have a different number of target binding sites in untranslated regions of a GAM158 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25341] The complementary binding of GAM158 RNA, herein designated GAM RNA, to target binding sites on GAM158 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, in-

hibits translation of GAM158 target RNA into GAM158 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25342] It is appreciated that GAM158 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM158 target genes. The mRNA of each one of this plurality of GAM158 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM158 RNA, herein designated GAM RNA, and which when bound by GAM158 RNA causes inhibition of translation of respective one or more GAM158 target proteins.

[25343] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM158 gene, herein designated GAM GENE, on one or more GAM158 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by

those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25344] It is appreciated that specific functions and accordingly utilities of GAM158 correlate with, and may be deduced from, the identity of the target genes which GAM158 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25345]

[25346]

[25347] KIAA0237 (Accession NM_014747.1) is a GAM158 target gene, herein designated TARGET GENE. KIAA0237 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0237, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0237 BINDING SITE, designated SEQ ID:13040, to the nucleotide sequence of GAM158 RNA, herein designated GAM RNA, also designated SEQ ID:383.

[25348] A function of GAM158 is therefore inhibition of KIAA0237 (Accession NM_014747.1) . Accordingly, utilities of GAM158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0237.

[25349] KIAA1045 (Accession XM_048592.2) is another GAM158 target gene, herein designated TARGET GENE. KIAA1045 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1045, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1045 BINDING SITE, designated SEQ ID:19310, to the nucleotide sequence of GAM158 RNA, herein designated GAM RNA, also designated SEQ ID:383.

[25350] Another function of GAM158 is therefore inhibition of KIAA1045 (Accession XM_048592.2) . Accordingly, utilities of GAM158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1045.

[25351] KIAA1110 (Accession) is another GAM158 target gene, herein designated TARGET GENE. KIAA1110 BINDING SITE is a target binding site found in the 3` untranslated re-

gion of mRNA encoded by KIAA1110, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1110 BINDING SITE, designated SEQ ID:1213, to the nucleotide sequence of GAM158 RNA, herein designated GAM RNA, also designated SEQ ID:383.

[25352] Another function of GAM158 is therefore inhibition of KIAA1110 (Accession) . Accordingly, utilities of GAM158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1110.

[25353] LOC124602 (Accession) is another GAM158 target gene, herein designated TARGET GENE. LOC124602 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC124602, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC124602 BINDING SITE, designated SEQ ID:1663, to the nucleotide sequence of GAM158 RNA, herein designated GAM RNA, also designated SEQ ID:383.

[25354] Another function of GAM158 is therefore inhibition of LOC124602 (Accession) . Accordingly, utilities of

GAM158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124602.

[25355] LOC253866 (Accession) is another GAM158 target gene, herein designated TARGET GENE. LOC253866 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC253866, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC253866 BINDING SITE, designated SEQ ID:11918, to the nucleotide sequence of GAM158 RNA, herein designated GAM RNA, also designated SEQ ID:383.

[25356] Another function of GAM158 is therefore inhibition of LOC253866 (Accession) . Accordingly, utilities of GAM158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253866.

[25357] LOC92305 (Accession NM_138385.1) is another GAM158 target gene, herein designated TARGET GENE. LOC92305 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC92305, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC92305 BINDING SITE, designated SEQ ID:16687, to the nucleotide sequence of GAM158 RNA, herein designated GAM RNA, also designated SEQ ID:383.

[25358] Another function of GAM158 is therefore inhibition of LOC92305 (Accession NM_138385.1) . Accordingly, utilities of GAM158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92305.

[25359] Rab9b, member ras oncogene family (RAB9B, Accession NM_016370.1) is another GAM158 target gene, herein designated TARGET GENE. RAB9B BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by RAB9B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAB9B BINDING SITE, designated SEQ ID:12877, to the nucleotide sequence of GAM158 RNA, herein designated GAM RNA, also designated SEQ ID:383.

[25360] Another function of GAM158 is therefore inhibition of Rab9b, member ras oncogene family (RAB9B, Accession

NM_016370.1) . Accordingly, utilities of GAM158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB9B.

[25361] Syntaxin 1a (brain) (STX1A, Accession NM_004603.1) is another GAM158 target gene, herein designated TARGET GENE. STX1A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by STX1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STX1A BINDING SITE, designated SEQ ID:18630, to the nucleotide sequence of GAM158 RNA, herein designated GAM RNA, also designated SEQ ID:383.

[25362] Another function of GAM158 is therefore inhibition of Syntaxin 1a (brain) (STX1A, Accession NM_004603.1), a gene which may play a critical role in neurotransmitter exocytosis. Accordingly, utilities of GAM158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STX1A.

[25363] The function of STX1A has been established by previous studies. Synaptic vesicles store neurotransmitters that are released during calcium- regulated exocytosis. The specificity of neurotransmitter release requires the localization

of both synaptic vesicles and calcium channels to the presynaptic active zone. Syntaxins function in this vesicle fusion process. Syntaxins also serve as a substrate for botulinum neurotoxin type C, a metalloprotease that blocks exocytosis and has high affinity for a molecular complex that includes the alpha- latrotoxin receptor (OMIM Ref. No. 600565) which produces explosive exocytosis (Zhang et al., 1995). Bennett et al. (1992) identified two 35- kD proteins (p35 or syntaxins) that interact with synaptic vesicle protein p65 (synaptotagmin; 185605). The p35 proteins are expressed only in the nervous system. The 2 proteins are 84% identical, include C- terminal membrane anchors, and are concentrated on the plasma membrane at synaptic sites. The authors speculated that the p35 proteins may function in docking synaptic vesicles near calcium channels at presynaptic active zones.

[25364]

[25365] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25366] Bennett, M. K.; Calakos, N.; Scheller, R. H. : Syntaxin: a synaptic protein implicated in docking of synaptic vesicles at presynaptic active zones. Science 257: 255- 259, 1992.

; and

[25367] Zhang, R.; Maksymowych, A. B.; Simpson, L. L. : Cloning and sequence analysis of a cDNA encoding human syntaxin 1A, a polypeptide essential for exocytosis. Gene 159: 293- 294, 1995.

[25368] Further studies establishing the function and utilities of STX1A are found in John Hopkins OMIM database record ID 186590, and in cited publications listed in Table 5, which are hereby incorporated by reference.SUN1 (Accession) is another GAM158 target gene, herein designated TARGET GENE. SUN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SUN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SUN1 BINDING SITE, designated SEQ ID:9645, to the nucleotide sequence of GAM158 RNA, herein designated GAM RNA, also designated SEQ ID:383.

[25369] Another function of GAM158 is therefore inhibition of SUN1 (Accession) . Accordingly, utilities of GAM158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUN1.

[25370]

[25371] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 159 (GAM159), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25372] GAM159 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM159 was detected is described hereinabove with reference to Figs. 8-15.

[25373] GAM159 gene, herein designated GAM GENE, and GAM159 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[25374] GAM159 gene encodes a GAM159 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM159 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM159 precursor RNA is designated SEQ ID:109, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:109 is located at position 125133292 relative to chromosome 9.

[25375] GAM159 precursor RNA folds onto itself, forming GAM159

folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25376] GAM159 precursor RNA folds onto itself, forming GAM159 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[25377] Nucleotide sequence of GAM159 precursor RNA, designated SEQ-ID: 109, and a schematic representation of a predicted secondary folding of GAM159 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[25378] An enzyme complex designated DICER COMPLEX, `dices`

the GAM159 folded precursor RNA into GAM159 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: B) nucleotide sequence of GAM159 RNA is designated SEQ ID:230, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[25379] GAM159 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM159 target RNA, herein designated GAM TARGET RNA. GAM159 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25380] GAM159 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM159 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM159

RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM159 RNA may have a different number of target binding sites in untranslated regions of a GAM159 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25381] The complementary binding of GAM159 RNA, herein designated GAM RNA, to target binding sites on GAM159 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM159 target RNA into GAM159 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25382] It is appreciated that GAM159 target gene, herein designated TARGET GENE, in fact represents a plurality of

GAM159 target genes. The mRNA of each one of this plurality of GAM159 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM159 RNA, herein designated GAM RNA, and which when bound by GAM159 RNA causes inhibition of translation of respective one or more GAM159 target proteins.

[25383] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM159 gene, herein designated GAM GENE, on one or more GAM159 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25384] It is appreciated that specific functions and accordingly utilities of GAM159 correlate with, and may be deduced from, the identity of the target genes which GAM159 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25385]

[25386]

[25387] AF5Q31 (Accession NM_014423.1) is a GAM159 target gene, herein designated TARGET GENE. AF5Q31 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by AF5Q31, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AF5Q31 BINDING SITE, designated SEQ ID:13598, to the nucleotide sequence of GAM159 RNA, herein designated GAM RNA, also designated SEQ ID:230.

[25388] A function of GAM159 is therefore inhibition of AF5Q31 (Accession NM_014423.1) . Accordingly, utilities of GAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AF5Q31.

[25389] APPD (Accession) is another GAM159 target gene, herein

designated TARGET GENE. APPD BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APPD BINDING SITE, designated SEQ ID:14424, to the nucleotide sequence of GAM159 RNA, herein designated GAM RNA, also designated SEQ ID:230.

[25390] Another function of GAM159 is therefore inhibition of APPD (Accession) . Accordingly, utilities of GAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APPD.

[25391] Digeorge syndrome critical region gene 6 (DGCR6, Accession NM_005675.2) is another GAM159 target gene, herein designated TARGET GENE. DGCR6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DGCR6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DGCR6 BINDING SITE, designated SEQ ID:10368, to the nucleotide sequence of GAM159 RNA, herein designated GAM RNA,

also designated SEQ ID:230.

[25392] Another function of GAM159 is therefore inhibition of Di-george syndrome critical region gene 6 (DGCR6, Accession NM_005675.2) . Accordingly, utilities of GAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGCR6.

[25393] FLJ13710 (Accession NM_024817.1) is another GAM159 target gene, herein designated TARGET GENE. FLJ13710 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13710, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13710 BINDING SITE, designated SEQ ID:19395, to the nucleotide sequence of GAM159 RNA, herein designated GAM RNA, also designated SEQ ID:230.

[25394] Another function of GAM159 is therefore inhibition of FLJ13710 (Accession NM_024817.1) . Accordingly, utilities of GAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13710.

[25395] Gata binding protein 2 (GATA2, Accession) is another GAM159 target gene, herein designated TARGET GENE.

GATA2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GATA2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GATA2 BINDING SITE, designated SEQ ID:13334, to the nucleotide sequence of GAM159 RNA, herein designated GAM RNA, also designated SEQ ID:230.

[25396] Another function of GAM159 is therefore inhibition of Gata binding protein 2 (GATA2, Accession) . Accordingly, utilities of GAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GATA2.

[25397] Huntingtin (huntington disease) (HD, Accession NM_002111.3) is another GAM159 target gene, herein designated TARGET GENE. HD BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HD BINDING SITE, designated SEQ ID:15165, to the nucleotide sequence of GAM159 RNA, herein designated GAM RNA, also designated SEQ ID:230.

[25398] Another function of GAM159 is therefore inhibition of Huntingtin (huntington disease) (HD, Accession NM_002111.3) . Accordingly, utilities of GAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HD.

[25399] KIAA0953 (Accession XM_039733.2) is another GAM159 target gene, herein designated TARGET GENE. KIAA0953 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0953, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0953 BINDING SITE, designated SEQ ID:11636, to the nucleotide sequence of GAM159 RNA, herein designated GAM RNA, also designated SEQ ID:230.

[25400] Another function of GAM159 is therefore inhibition of KIAA0953 (Accession XM_039733.2) . Accordingly, utilities of GAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0953.

[25401] LOC151438 (Accession XM_098060.1) is another GAM159 target gene, herein designated TARGET GENE. LOC151438 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC151438, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151438 BINDING SITE, designated SEQ ID:18291, to the nucleotide sequence of GAM159 RNA, herein designated GAM RNA, also designated SEQ ID:230.

[25402] Another function of GAM159 is therefore inhibition of LOC151438 (Accession XM_098060.1) . Accordingly, utilities of GAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151438.

[25403] LOC91748 (Accession) is another GAM159 target gene, herein designated TARGET GENE. LOC91748 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91748, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91748 BINDING SITE, designated SEQ ID:1274, to the nucleotide sequence of GAM159 RNA, herein designated GAM RNA, also designated SEQ ID:230.

[25404] Another function of GAM159 is therefore inhibition of

LOC91748 (Accession) . Accordingly, utilities of GAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91748.

[25405] SDR1 (Accession NM_004753.1) is another GAM159 target gene, herein designated TARGET GENE. SDR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SDR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SDR1 BINDING SITE, designated SEQ ID:19713, to the nucleotide sequence of GAM159 RNA, herein designated GAM RNA, also designated SEQ ID:230.

[25406] Another function of GAM159 is therefore inhibition of SDR1 (Accession NM_004753.1) . Accordingly, utilities of GAM159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDR1.

[25407]

[25408] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 160 (GAM160), which modulates expression of respective target genes thereof, the function and utility of which target

genes is known in the art.

[25409] GAM160 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM160 was detected is described hereinabove with reference to Figs. 8-15.

[25410] GAM160 gene, herein designated GAM GENE, and GAM160 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[25411] GAM160 gene encodes a GAM160 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM160 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM160 precursor RNA is designated SEQ ID:174, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:174 is located at position 150162171 relative to chromosome 3.

[25412] GAM160 precursor RNA folds onto itself, forming GAM160 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25413] GAM160 precursor RNA folds onto itself, forming GAM160 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[25414] Nucleotide sequence of GAM160 precursor RNA, designated SEQ-ID: 174, and a schematic representation of a predicted secondary folding of GAM160 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[25415] An enzyme complex designated DICER COMPLEX, `dices` the GAM160 folded precursor RNA into GAM160 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM160 RNA is designated SEQ ID:343, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[25416] GAM160 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM160 target RNA, herein designated GAM TARGET RNA. GAM160 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25417] GAM160 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM160 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM160 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated

that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM160 RNA may have a different number of target binding sites in untranslated regions of a GAM160 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25418] The complementary binding of GAM160 RNA, herein designated GAM RNA, to target binding sites on GAM160 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM160 target RNA into GAM160 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25419] It is appreciated that GAM160 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM160 target genes. The mRNA of each one of this plurality of GAM160 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM160 RNA, herein designated GAM RNA, and which when bound by

GAM160 RNA causes inhibition of translation of respective one or more GAM160 target proteins.

[25420] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM160 gene, herein designated GAM GENE, on one or more GAM160 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25421] It is appreciated that specific functions and accordingly utilities of GAM160 correlate with, and may be deduced from, the identity of the target genes which GAM160 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25422]

[25423]

[25424] LOC132235 (Accession XM_072302.2) is a GAM160 target gene, herein designated TARGET GENE. LOC132235 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC132235, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC132235 BINDING SITE, designated SEQ ID:13188, to the nucleotide sequence of GAM160 RNA, herein designated GAM RNA, also designated SEQ ID:343.

[25425] A function of GAM160 is therefore inhibition of LOC132235 (Accession XM_072302.2) . Accordingly, utilities of GAM160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132235.

[25426] Tnf receptor-associated factor 3 (TRAF3, Accession NM_145725.1) is another GAM160 target gene, herein designated TARGET GENE. TRAF3 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by TRAF3, correspond-

ing to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRAF3 BINDING SITE, designated SEQ ID:9111, to the nucleotide sequence of GAM160 RNA, herein designated GAM RNA, also designated SEQ ID:343.

[25427] Another function of GAM160 is therefore inhibition of Tnf receptor-associated factor 3 (TRAF3, Accession NM_145725.1) . Accordingly, utilities of GAM160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAF3.

[25428]

[25429] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 161 (GAM161), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25430] GAM161 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM161 was detected is described hereinabove with reference to Figs. 8-15.

[25431] GAM161 gene, herein designated GAM GENE, and

GAM161 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[25432] GAM161 gene encodes a GAM161 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM161 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM161 precursor RNA is designated SEQ ID:24, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:24 is located at position 3119977 relative to chromosome 1.

[25433] GAM161 precursor RNA folds onto itself, forming GAM161 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25434] GAM161 precursor RNA folds onto itself, forming GAM161 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[25435] Nucleotide sequence of GAM161 precursor RNA, designated SEQ-ID: 24, and a schematic representation of a predicted secondary folding of GAM161 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[25436] An enzyme complex designated DICER COMPLEX, `dices` the GAM161 folded precursor RNA into GAM161 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM161 RNA is designated SEQ ID:304, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[25437] GAM161 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM161 target RNA, herein designated GAM TARGET RNA. GAM161 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25438] GAM161 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM161 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM161 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM161 RNA may have a different number of target binding sites in untranslated regions of a GAM161 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an

example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25439] The complementary binding of GAM161 RNA, herein designated GAM RNA, to target binding sites on GAM161 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM161 target RNA into GAM161 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25440] It is appreciated that GAM161 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM161 target genes. The mRNA of each one of this plurality of GAM161 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM161 RNA, herein designated GAM RNA, and which when bound by GAM161 RNA causes inhibition of translation of respective one or more GAM161 target proteins.

[25441] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM161 gene, herein designated GAM GENE, on one or

more GAM161 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25442] It is appreciated that specific functions and accordingly utilities of GAM161 correlate with, and may be deduced from, the identity of the target genes which GAM161 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25443]

[25444]

[25445] APM1 (Accession NM_004797.1) is a GAM161 target gene, herein designated TARGET GENE. APM1 BINDING SITE is a target binding site found in the 3` untranslated region of

mRNA encoded by APM1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APM1 BINDING SITE, designated SEQ ID:9908, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25446] A function of GAM161 is therefore inhibition of APM1 (Accession NM_004797.1) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APM1.

[25447] B-cell cll/lymphoma 10 (BCL10, Accession NM_003921.2) is another GAM161 target gene, herein designated TARGET GENE. BCL10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BCL10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BCL10 BINDING SITE, designated SEQ ID:8318, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25448] Another function of GAM161 is therefore inhibition of B-cell cll/lymphoma 10 (BCL10, Accession NM_003921.2), a

gene which is a positive regulator of lymphocyte proliferation, NF- kappaB activator. and therefore may be associated with Malt lymphoma, follicular lymphoma. Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of Malt lymphoma, follicular lymphoma, and of other diseases and clinical conditions associated with BCL10.

[25449] The function of BCL10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM136.1.Chromosome 13 open reading frame 1 (C13orf1, Accession NM_020456.1) is another GAM161 target gene, herein designated TARGET GENE. C13orf1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C13orf1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C13orf1 BINDING SITE, designated SEQ ID:12864, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25450] Another function of GAM161 is therefore inhibition of Chromosome 13 open reading frame 1 (C13orf1, Acces-

sion NM_020456.1) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C13orf1.

[25451] Chromosome 21 open reading frame 67 (C21orf67, Accession NM_058188.1) is another GAM161 target gene, herein designated TARGET GENE. C21orf67 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by C21orf67, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C21orf67 BINDING SITE, designated SEQ ID:12444, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25452] Another function of GAM161 is therefore inhibition of Chromosome 21 open reading frame 67 (C21orf67, Accession NM_058188.1) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf67.

[25453] Chromosome 6 open reading frame 33 (C6orf33, Accession NM_133367.1) is another GAM161 target gene, herein designated TARGET GENE. C6orf33 BINDING SITE is a target binding site found in the 3` untranslated region

of mRNA encoded by C6orf33, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C6orf33 BINDING SITE, designated SEQ ID:14623, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25454] Another function of GAM161 is therefore inhibition of Chromosome 6 open reading frame 33 (C6orf33, Accession NM_133367.1) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf33.

[25455] Chromosome 9 open reading frame 9 (C9orf9, Accession NM_018956.2) is another GAM161 target gene, herein designated TARGET GENE. C9orf9 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by C9orf9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C9orf9 BINDING SITE, designated SEQ ID:10257, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25456] Another function of GAM161 is therefore inhibition of Chromosome 9 open reading frame 9 (C9orf9, Accession NM_018956.2) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf9.

[25457] Cadherin 17, li cadherin (liver-intestine) (CDH17, Accession NM_004063.2) is another GAM161 target gene, herein designated TARGET GENE. CDH17 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CDH17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDH17 BINDING SITE, designated SEQ ID:1297, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25458] Another function of GAM161 is therefore inhibition of Cadherin 17, li cadherin (liver-intestine) (CDH17, Accession NM_004063.2), a gene which may have a role in the morphological organization of liver and intestine and involved in intestinal peptide transport. Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH17.

[25459] The function of CDH17 has been established by previous studies. The first step in oral absorption of many medically important peptide- based drugs, such as beta- lactam antibiotics, is mediated by an intestinal proton- dependent peptide transporter. Dantzig et al. (1994) identified a monoclonal antibody that blocked uptake of the beta- lactam cephalexin by human cells. By screening an expression library with this antibody, the authors isolated cDNAs encoding a protein that they designated 'human peptide transporter- 1,' or HPT1. Sequence analysis revealed that the predicted 832- amino acid protein shares several structural features with the cadherin superfamily of calcium- dependent cell- cell adhesion proteins. See 603006. Like the cadherins, HPT1 contains an extracellular region with conserved motifs and a transmembrane domain. However, HPT1 lacks the cytoplasmic domain found in other cadherins. Using immunohistochemical staining, Dantzig et al. (1994) localized HPT1 along the gastrointestinal tract and the pancreatic ducts, but not in kidney, lung, or several other tissues. Mammalian cells expressing HPT1 showed consistently higher cephalexin uptake activity than controls. Uptake was dependent on an inwardly directed proton gradient.

[25460]

[25461] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25462] Dantzig, A. H.; Hoskins, J.; Tabas, L. B.; Bright, S.; Shepard, R. L.; Jenkins, I. L.; Duckworth, D. C.; Sportsman, J. R.; Mackensen, D.; Rosteck, P. R., Jr.; Skatrud, P. L. : Association of intestinal peptide transport with a protein related to the cadherin superfamily. Science 264: 430- 433, 1994. ; and

[25463] Kremmidiotis, G.; Baker, E.; Crawford, J.; Eyre, H. J.; Nahmias, J.; Callen, D. F. : Localization of human cadherin genes to chromosome regions exhibiting cancer- related loss of heteroz.

[25464] Further studies establishing the function and utilities of CDH17 are found in John Hopkins OMIM database record ID 603017, and in cited publications listed in Table 5, which are hereby incorporated by reference.Fc fragment of iga, receptor for (FCAR, Accession NM_002000.2) is another GAM161 target gene, herein designated TARGET GENE. FCAR BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FCAR, corresponding to a target bind-

ing site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FCAR BINDING SITE, designated SEQ ID:8313, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25465] Another function of GAM161 is therefore inhibition of Fc fragment of iga, receptor for (FCAR, Accession NM_002000.2), a gene which binds to the fc region of immunoglobulins alpha and mediates several functions including cytokine production. and therefore may be associated with Iga nephropathy. Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of Iga nephropathy., and of other diseases and clinical conditions associated with FCAR.

[25466] The function of FCAR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM136.1.Fasciculation and elongation protein zeta 1 (zygin i) (FEZ1, Accession NM_005103.3) is another GAM161 target gene, herein designated TARGET GENE. FEZ1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA en-

coded by FEZ1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FEZ1 BINDING SITE, designated SEQ ID:8241, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25467] Another function of GAM161 is therefore inhibition of Fasciculation and elongation protein zeta 1 (zygin i) (FEZ1, Accession NM_005103.3), a gene which Zygin 1; may have a role in axonal outgrowth; has similarity to C. elegans UNC- 76. Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FEZ1.

[25468] The function of FEZ1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.FLJ10232 (Accession NM_018033.1) is another GAM161 target gene, herein designated TARGET GENE. FLJ10232 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10232, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of FLJ10232 BINDING SITE, designated SEQ ID:12255, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25469] Another function of GAM161 is therefore inhibition of FLJ10232 (Accession NM_018033.1) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10232.

[25470] FLJ12787 (Accession NM_032175.1) is another GAM161 target gene, herein designated TARGET GENE. FLJ12787 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12787, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12787 BINDING SITE, designated SEQ ID:7408, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25471] Another function of GAM161 is therefore inhibition of FLJ12787 (Accession NM_032175.1) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ12787.

[25472] FLJ13114 (Accession NM_024541.1) is another GAM161 target gene, herein designated TARGET GENE. FLJ13114 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ13114, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13114 BINDING SITE, designated SEQ ID:930, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25473] Another function of GAM161 is therefore inhibition of FLJ13114 (Accession NM_024541.1) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13114.

[25474] FLJ13188 (Accession NM_022063.1) is another GAM161 target gene, herein designated TARGET GENE. FLJ13188 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13188, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ13188 BINDING SITE, designated SEQ ID:3353, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25475] Another function of GAM161 is therefore inhibition of FLJ13188 (Accession NM_022063.1) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13188.

[25476] FLJ13456 (Accession XM_038291.5) is another GAM161 target gene, herein designated TARGET GENE. FLJ13456 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13456, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13456 BINDING SITE, designated SEQ ID:12949, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25477] Another function of GAM161 is therefore inhibition of FLJ13456 (Accession XM_038291.5) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13456.

[25478] FLJ20136 (Accession NM_017684.1) is another GAM161 target gene, herein designated TARGET GENE. FLJ20136 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20136, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20136 BINDING SITE, designated SEQ ID:8713, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25479] Another function of GAM161 is therefore inhibition of FLJ20136 (Accession NM_017684.1) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20136.

[25480] FLJ20507 (Accession NM_017849.1) is another GAM161 target gene, herein designated TARGET GENE. FLJ20507 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20507, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20507 BINDING SITE, designated SEQ ID:19171, to the

nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25481] Another function of GAM161 is therefore inhibition of FLJ20507 (Accession NM_017849.1) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20507.

[25482] FLJ31153 (Accession NM_144600.1) is another GAM161 target gene, herein designated TARGET GENE. FLJ31153 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ31153, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31153 BINDING SITE, designated SEQ ID:1064, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25483] Another function of GAM161 is therefore inhibition of FLJ31153 (Accession NM_144600.1) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31153.

[25484] FLJ32865 (Accession NM_144613.1) is another GAM161

target gene, herein designated TARGET GENE. FLJ32865 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32865, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32865 BINDING SITE, designated SEQ ID:15270, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25485] Another function of GAM161 is therefore inhibition of FLJ32865 (Accession NM_144613.1) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32865.

[25486] GR6 (Accession NM_007354.1) is another GAM161 target gene, herein designated TARGET GENE. GR6 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GR6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GR6 BINDING SITE, designated SEQ ID:11991, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA,

also designated SEQ ID:304.

[25487] Another function of GAM161 is therefore inhibition of GR6 (Accession NM_007354.1) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GR6.

[25488] H2AV (Accession NM_138635.1) is another GAM161 target gene, herein designated TARGET GENE. H2AV BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by H2AV, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of H2AV BINDING SITE, designated SEQ ID:4146, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25489] Another function of GAM161 is therefore inhibition of H2AV (Accession NM_138635.1) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H2AV.

[25490] HCA4 (Accession) is another GAM161 target gene, herein designated TARGET GENE. HCA4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HCA4, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HCA4 BINDING SITE, designated SEQ ID:18806, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25491] Another function of GAM161 is therefore inhibition of HCA4 (Accession) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCA4.

[25492] Histamine receptor h4 (HRH4, Accession NM_021624.2) is another GAM161 target gene, herein designated TARGET GENE. HRH4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HRH4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HRH4 BINDING SITE, designated SEQ ID:18713, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25493] Another function of GAM161 is therefore inhibition of Histamine receptor h4 (HRH4, Accession NM_021624.2) . Accordingly, utilities of GAM161 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with HRH4.

[25494] 5-hydroxytryptamine (serotonin) receptor 1e (HTR1E, Accession NM_000865.1) is another GAM161 target gene, herein designated TARGET GENE. HTR1E BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HTR1E, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HTR1E BINDING SITE, designated SEQ ID:3407, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25495] Another function of GAM161 is therefore inhibition of 5-hydroxytryptamine (serotonin) receptor 1e (HTR1E, Accession NM_000865.1), a gene which belongs to g- protein coupled receptors. Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTR1E.

[25496] The function of HTR1E has been established by previous studies. Serotonin (5- hydroxytryptamine; 5- HT) is a neurotransmitter thought to play a role in various cognitive and behavioral functions including feeding, sleep, pain, depression, and learning. Serotonin receptors have been divided into 4 classes designated 5- HT- 1- like, 5- HT- 2 (OMIM Ref. No. 182135), 5- HT- 3 (OMIM Ref. No. 182139), and 5- HT- 4 (OMIM Ref. No. 602128), depending on their ligand binding and effector- coupling properties. McAllister et al. (1992) stated the 5- HT- 1 receptor family can be further subdivided into 4 subtypes, 5- HT- 1A to 5- HT- 1D. McAllister et al. (1992) described the cloning and characterization of a 5- HT- 1E receptor. The excellent correlation observed between the pharmacology of the expressed receptor and the human brain 5- HT- 1E binding site confirmed that their clone encodes a 5- HT- 1E receptor and establishes a fifth 5- HT- 1- like receptor subtype. Using 2 independent polymerase chain reactions on a panel of human- hamster somatic cell hybrid genomic DNA, Levy et al. (1994) showed that the 5- hydroxytryptamine- 1E serotonin receptor gene is located on human chromosome 6. Furthermore, by means of in situ hybridization to human metaphase chromosomes using the

cloned gene as a probe (Levy et al., 1992), they demonstrated that the gene is located on 6q14- q15. HTR1E is found mainly in cerebral cortex, and the precise chromosomal assignment of the gene may help evaluate this locus as a candidate for mutations in neurologic and psychiatric diseases.

[25497]

[25498] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25499] Levy, F. O.; Holtgreve- Grez, H.; Tasken, K.; Solberg, R.; Ried, T.; Gudermann, T. : Assignment of the gene encoding the 5- HT- 1E serotonin receptor (S31) (locus HTR1E) to human chromosome 6q14- q15. Genomics 22: 637-640, 1994. ; and

[25500] McAllister, G.; Charlesworth, A.; Snodin, C.; Beer, M. S.; Noble, A. J.; Middlemiss, D. N.; Iversen, L. L.; Whiting, P. : Molecular cloning of a serotonin receptor from human brain (5HT.

[25501] Further studies establishing the function and utilities of HTR1E are found in John Hopkins OMIM database record ID 182132, and in cited publications listed in Table 5, which are hereby incorporated by reference.Interferon

(alpha, beta and omega) receptor 2 (IFNAR2, Accession NM_000874.2) is another GAM161 target gene, herein designated TARGET GENE. IFNAR2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IFNAR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IFNAR2 BINDING SITE, designated SEQ ID:8000, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25502] Another function of GAM161 is therefore inhibition of Interferon (alpha, beta and omega) receptor 2 (IFNAR2, Accession NM_000874.2), a gene which is a receptor for interferons alpha and beta. Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IFNAR2.

[25503] The function of IFNAR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.KIAA0161 (Accession) is another GAM161 target gene, herein designated TARGET GENE. KIAA0161 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0161, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0161 BINDING SITE, designated SEQ ID:17542, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25504] Another function of GAM161 is therefore inhibition of KIAA0161 (Accession) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0161.

[25505] KIAA0599 (Accession XM_085127.6) is another GAM161 target gene, herein designated TARGET GENE. KIAA0599 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0599, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0599 BINDING SITE, designated SEQ ID:6311, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25506] Another function of GAM161 is therefore inhibition of KIAA0599 (Accession XM_085127.6) . Accordingly, utilities of GAM161 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0599.

[25507] KIAA1028 (Accession) is another GAM161 target gene, herein designated TARGET GENE. KIAA1028 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1028, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1028 BINDING SITE, designated SEQ ID:4329, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25508] Another function of GAM161 is therefore inhibition of KIAA1028 (Accession) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1028.

[25509] KIAA1456 (Accession XM_040100.4) is another GAM161 target gene, herein designated TARGET GENE. KIAA1456 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1456, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

KIAA1456 BINDING SITE, designated SEQ ID:6378, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25510] Another function of GAM161 is therefore inhibition of KIAA1456 (Accession XM_040100.4) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1456.

[25511] KIAA1508 (Accession XM_290952.1) is another GAM161 target gene, herein designated TARGET GENE. KIAA1508 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1508, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1508 BINDING SITE, designated SEQ ID:2567, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25512] Another function of GAM161 is therefore inhibition of KIAA1508 (Accession XM_290952.1) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1508.

[25513] KIAA1655 (Accession) is another GAM161 target gene, herein designated TARGET GENE. KIAA1655 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1655, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1655 BINDING SITE, designated SEQ ID:19930, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25514] Another function of GAM161 is therefore inhibition of KIAA1655 (Accession) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1655.

[25515] KIAA1877 (Accession) is another GAM161 target gene, herein designated TARGET GENE. KIAA1877 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1877, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1877 BINDING SITE, designated SEQ ID:4810, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA,

also designated SEQ ID:304.

[25516] Another function of GAM161 is therefore inhibition of KIAA1877 (Accession) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1877.

[25517] LOC126133 (Accession) is another GAM161 target gene, herein designated TARGET GENE. LOC126133 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC126133, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC126133 BINDING SITE, designated SEQ ID:13929, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25518] Another function of GAM161 is therefore inhibition of LOC126133 (Accession) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126133.

[25519] LOC128077 (Accession) is another GAM161 target gene, herein designated TARGET GENE. LOC128077 BINDING SITE is a target binding site found in the 3` untranslated

region of mRNA encoded by LOC128077, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC128077 BINDING SITE, designated SEQ ID:12251, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25520] Another function of GAM161 is therefore inhibition of LOC128077 (Accession) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128077.

[25521] LOC130813 (Accession XM_065904.2) is another GAM161 target gene, herein designated TARGET GENE. LOC130813 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC130813, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC130813 BINDING SITE, designated SEQ ID:18432, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25522] Another function of GAM161 is therefore inhibition of

LOC130813 (Accession XM_065904.2) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130813.

[25523] LOC144317 (Accession XM_084813.4) is another GAM161 target gene, herein designated TARGET GENE. LOC144317 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC144317, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144317 BINDING SITE, designated SEQ ID:12865, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25524] Another function of GAM161 is therefore inhibition of LOC144317 (Accession XM_084813.4) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144317.

[25525] LOC146455 (Accession) is another GAM161 target gene, herein designated TARGET GENE. LOC146455 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146455, corresponding

to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146455 BINDING SITE, designated SEQ ID:12181, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25526] Another function of GAM161 is therefore inhibition of LOC146455 (Accession) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146455.

[25527] LOC148137 (Accession NM_144692.1) is another GAM161 target gene, herein designated TARGET GENE. LOC148137 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC148137, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148137 BINDING SITE, designated SEQ ID:14101, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25528] Another function of GAM161 is therefore inhibition of LOC148137 (Accession NM_144692.1) . Accordingly, utili-

ties of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148137.

[25529] LOC151201 (Accession XM_098021.1) is another GAM161 target gene, herein designated TARGET GENE. LOC151201 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC151201, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151201 BINDING SITE, designated SEQ ID:19905, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25530] Another function of GAM161 is therefore inhibition of LOC151201 (Accession XM_098021.1) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151201.

[25531] LOC151701 (Accession) is another GAM161 target gene, herein designated TARGET GENE. LOC151701 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC151701, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151701 BINDING SITE, designated SEQ ID:2777, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25532] Another function of GAM161 is therefore inhibition of LOC151701 (Accession) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151701.

[25533] LOC152245 (Accession XM_098182.1) is another GAM161 target gene, herein designated TARGET GENE. LOC152245 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC152245, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152245 BINDING SITE, designated SEQ ID:6203, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25534] Another function of GAM161 is therefore inhibition of LOC152245 (Accession XM_098182.1) . Accordingly, utilities of GAM161 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC152245.

[25535] LOC153077 (Accession XM_098307.1) is another GAM161 target gene, herein designated TARGET GENE. LOC153077 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC153077, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153077 BINDING SITE, designated SEQ ID:11568, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25536] Another function of GAM161 is therefore inhibition of LOC153077 (Accession XM_098307.1) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153077.

[25537] LOC153688 (Accession) is another GAM161 target gene, herein designated TARGET GENE. LOC153688 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC153688, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the

complementarity of the nucleotide sequences of LOC153688 BINDING SITE, designated SEQ ID:12866, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25538] Another function of GAM161 is therefore inhibition of LOC153688 (Accession) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153688.

[25539] LOC153811 (Accession XM_087779.2) is another GAM161 target gene, herein designated TARGET GENE. LOC153811 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC153811, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153811 BINDING SITE, designated SEQ ID:16081, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25540] Another function of GAM161 is therefore inhibition of LOC153811 (Accession XM_087779.2) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC153811.

[25541] LOC158310 (Accession XM_098919.1) is another GAM161 target gene, herein designated TARGET GENE. LOC158310 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC158310, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158310 BINDING SITE, designated SEQ ID:8794, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25542] Another function of GAM161 is therefore inhibition of LOC158310 (Accession XM_098919.1) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158310.

[25543] LOC196047 (Accession) is another GAM161 target gene, herein designated TARGET GENE. LOC196047 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC196047, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LOC196047 BINDING SITE, designated SEQ ID:1349, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25544] Another function of GAM161 is therefore inhibition of LOC196047 (Accession) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196047.

[25545] LOC199786 (Accession) is another GAM161 target gene, herein designated TARGET GENE. LOC199786 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC199786, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC199786 BINDING SITE, designated SEQ ID:11992, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25546] Another function of GAM161 is therefore inhibition of LOC199786 (Accession) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199786.

[25547] LOC200301 (Accession) is another GAM161 target gene, herein designated TARGET GENE. LOC200301 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC200301, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200301 BINDING SITE, designated SEQ ID:15098, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25548] Another function of GAM161 is therefore inhibition of LOC200301 (Accession) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200301.

[25549] LOC200316 (Accession) is another GAM161 target gene, herein designated TARGET GENE. LOC200316 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC200316, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200316 BINDING SITE, designated SEQ ID:19042, to

the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25550] Another function of GAM161 is therefore inhibition of LOC200316 (Accession) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200316.

[25551] LOC220575 (Accession) is another GAM161 target gene, herein designated TARGET GENE. LOC220575 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC220575, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC220575 BINDING SITE, designated SEQ ID:18968, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25552] Another function of GAM161 is therefore inhibition of LOC220575 (Accession) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220575.

[25553] LOC221271 (Accession) is another GAM161 target gene,

herein designated TARGET GENE. LOC221271 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC221271, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221271 BINDING SITE, designated SEQ ID:6488, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25554] Another function of GAM161 is therefore inhibition of LOC221271 (Accession) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221271.

[25555] LOC245771 (Accession) is another GAM161 target gene, herein designated TARGET GENE. LOC245771 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC245771, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC245771 BINDING SITE, designated SEQ ID:14795, to the nucleotide sequence of GAM161 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:304.

[25556] Another function of GAM161 is therefore inhibition of LOC245771 (Accession) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC245771.

[25557] LOC254082 (Accession) is another GAM161 target gene, herein designated TARGET GENE. LOC254082 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC254082, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC254082 BINDING SITE, designated SEQ ID:2709, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25558] Another function of GAM161 is therefore inhibition of LOC254082 (Accession) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254082.

[25559] LOC256306 (Accession) is another GAM161 target gene, herein designated TARGET GENE. LOC256306 BINDING

SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC256306, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC256306 BINDING SITE, designated SEQ ID:19369, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25560] Another function of GAM161 is therefore inhibition of LOC256306 (Accession) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256306.

[25561] LOC51696 (Accession) is another GAM161 target gene, herein designated TARGET GENE. LOC51696 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC51696, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC51696 BINDING SITE, designated SEQ ID:6670, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25562] Another function of GAM161 is therefore inhibition of LOC51696 (Accession) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51696.

[25563] Mediterranean fever (MEFV, Accession NM_000243.1) is another GAM161 target gene, herein designated TARGET GENE. MEFV BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MEFV, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MEFV BINDING SITE, designated SEQ ID:8754, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25564] Another function of GAM161 is therefore inhibition of Mediterranean fever (MEFV, Accession NM_000243.1) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEFV.

[25565] MGC10818 (Accession NM_030568.2) is another GAM161 target gene, herein designated TARGET GENE. MGC10818 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC10818, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC10818 BINDING SITE, designated SEQ ID:4141, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25566] Another function of GAM161 is therefore inhibition of MGC10818 (Accession NM_030568.2) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10818.

[25567] MGC13138 (Accession NM_033410.1) is another GAM161 target gene, herein designated TARGET GENE. MGC13138 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC13138, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC13138 BINDING SITE, designated SEQ ID:5265, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25568] Another function of GAM161 is therefore inhibition of MGC13138 (Accession NM_033410.1) . Accordingly, utili-

ties of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13138.

[25569] MGC29891 (Accession NM_144618.1) is another GAM161 target gene, herein designated TARGET GENE. MGC29891 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC29891, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC29891 BINDING SITE, designated SEQ ID:19764, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25570] Another function of GAM161 is therefore inhibition of MGC29891 (Accession NM_144618.1) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC29891.

[25571] Matrix metalloproteinase-like 1 (MMPL1, Accession) is another GAM161 target gene, herein designated TARGET GENE. MMPL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MMPL1, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MMPL1 BINDING SITE, designated SEQ ID:11792, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25572] Another function of GAM161 is therefore inhibition of Matrix metalloproteinase-like 1 (MMPL1, Accession) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMPL1.

[25573] Mitochondrial ribosomal protein l44 (MRPL44, Accession NM_022915.2) is another GAM161 target gene, herein designated TARGET GENE. MRPL44 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MRPL44, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MRPL44 BINDING SITE, designated SEQ ID:17368, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25574] Another function of GAM161 is therefore inhibition of Mi-

tochondrial ribosomal protein l44 (MRPL44, Accession NM_022915.2) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL44.

[25575] V-myc myelocytomatosis viral oncogene homolog 2 (avian) (MYCL2, Accession NM_005377.1) is another GAM161 target gene, herein designated TARGET GENE. MYCL2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MYCL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MYCL2 BINDING SITE, designated SEQ ID:8793, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25576] Another function of GAM161 is therefore inhibition of V-myc myelocytomatosis viral oncogene homolog 2 (avian) (MYCL2, Accession NM_005377.1) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYCL2.

[25577] Nuclear receptor coactivator 6 (NCOA6, Accession NM_014071.1) is another GAM161 target gene, herein designated TARGET GENE. NCOA6 BINDING SITE is a target

binding site found in the 5` untranslated region of mRNA encoded by NCOA6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NCOA6 BINDING SITE, designated SEQ ID:19170, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25578] Another function of GAM161 is therefore inhibition of Nuclear receptor coactivator 6 (NCOA6, Accession NM_014071.1), a gene which activates gene transcription through ligand- dependent association with coactivators. and therefore may be associated with Breast cancer. Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of Breast cancer., and of other diseases and clinical conditions associated with NCOA6.

[25579] The function of NCOA6 has been established by previous studies. Using the ligand- binding domain of the retinoid X receptor as bait in a yeast 2- hybrid screen to identify potential transcriptional coactivators of nuclear receptors, Lee et al. (1999) isolated a cDNA encoding a nuclear protein- activating signal cointegrator, which they designated ASC2. Sequence analysis of the 2,063 amino acid protein

predicted an N- terminal acidic domain, 2 glutamine- rich domains, and a C- terminal serine/threonine- rich domain as well as 2 separate basic potential nuclear localization signal domains and 2 copies of LXXLL motifs that function in ligand- dependent interaction with the AF2 domain of nuclear receptors. Analyzing tissue microarrays by FISH, Lee et al. (1999) found increased ASC2 copy number in 10% of breast cancer specimens and in all breast cancer cell lines. SDS- PAGE analysis showed that amino acids 586- 860, which do not include the LXXLL motifs, are the minimum interaction domain with the AF2 domain of numerous nuclear receptors. N- terminal subregions of ASC2, either alone or in conjunction with CBP (OMIM Ref. No. 600140) and SRC1 (NCOA1; 602691), stimulate ligand- dependent transactivation by wildtype nuclear receptors. Microinjection of anti- ASC2 into cells demonstrated abrogation of the transactivation function. Caira et al. (2000) and Mahajan and Samuels (2000) isolated cDNAs encoding a protein identical to ASC2, which they termed nuclear receptor- activating protein 250 kD (OMIM Ref. No. RAP250) and nuclear receptor coregulator (NRC), respectively. Northern blot analysis revealed widespread expression of an approximately 7.5- kb transcript, with a

4.5- kb splice variant detected in testis. Analysis of the testis sequence indicated that it encodes a 1,070 amino acid protein that lacks residues 972- 1964 of the full-length sequence (Caira et al., 2000). ASC2 was also found to be widely expressed during ontogeny in rat embryos. Using GST pull- down assays, Caira et al. (2000) determined that the first LXXLL motif (LVNLL, contained in residues 819- 1096) but not the second (LSQLL, residues 1491- 1495) interacted strongly with nuclear receptors. Mahajan and Samuels (2000) also found that only the first LXXLL domain is functional and that mutation of this sequence abolished transcriptional enhancement.

[25580]

[25581] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25582] Lee, S.- K.; Anzick, S. L.; Choi, J.- E.; Bubendorf, L.; Guan, X.- Y.; Jung, Y.- K.; Kallioniemi, O. P.; Kononen, J.; Trent, J. M.; Azorsa, D.; Jhun, B.- H.; Cheong, J. H.; Lee, Y. C.; Meltzer, P. S.; Lee, J. W. : A nuclear factor, ASC- 2, as a cancer- amplified transcriptional coactivator essential for ligand- dependent transactivation by nuclear receptors in vivo. J. Biol. Chem. 274: 34283- 34293, 1999. ; and

[25583] Mahajan, M. A.; Samuels, H. H : A new family of nuclear receptor coregulators that integrate nuclear receptor signaling through CREB- binding protein. Molec. Cell. Biol. 20: 5048- 5063.

[25584] Further studies establishing the function and utilities of NCOA6 are found in John Hopkins OMIM database record ID 605299, and in cited publications listed in Table 5, which are hereby incorporated by reference.Nuclear receptor coactivator 6 interacting protein (NCOA6IP, Accession NM_024831.5) is another GAM161 target gene, herein designated TARGET GENE. NCOA6IP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NCOA6IP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NCOA6IP BINDING SITE, designated SEQ ID:4013, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25585] Another function of GAM161 is therefore inhibition of Nuclear receptor coactivator 6 interacting protein (NCOA6IP, Accession NM_024831.5) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with NCOA6IP.

[25586] Oral-facial-digital syndrome 1 (OFD1, Accession NM_003611.1) is another GAM161 target gene, herein designated TARGET GENE. OFD1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by OFD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OFD1 BINDING SITE, designated SEQ ID:10775, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25587] Another function of GAM161 is therefore inhibition of Oral-facial-digital syndrome 1 (OFD1, Accession NM_003611.1) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OFD1.

[25588] Phosducin-like (PDCL, Accession NM_005388.2) is another GAM161 target gene, herein designated TARGET GENE. PDCL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PDCL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4

illustrates the complementarity of the nucleotide sequences of PDCL BINDING SITE, designated SEQ ID:848, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25589] Another function of GAM161 is therefore inhibition of Phosducin-like (PDCL, Accession NM_005388.2), a gene which may regulate G- protein signaling and similar to phosducins. Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDCL.

[25590] The function of PDCL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Phosphodiesterase 6b, cgmp-specific, rod, beta (congenital stationary night blindness 3, autosomal dominant) (PDE6B, Accession NM_000283.1) is another GAM161 target gene, herein designated TARGET GENE. PDE6B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PDE6B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDE6B BINDING SITE, designated SEQ ID:16553, to the

nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25591] Another function of GAM161 is therefore inhibition of Phosphodiesterase 6b, cgmp-specific, rod, beta (congenital stationary night blindness 3, autosomal dominant) (PDE6B, Accession NM_000283.1) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE6B.

[25592] Polymeric immunoglobulin receptor (PIGR, Accession NM_002644.1) is another GAM161 target gene, herein designated TARGET GENE. PIGR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PIGR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PIGR BINDING SITE, designated SEQ ID:3992, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25593] Another function of GAM161 is therefore inhibition of Polymeric immunoglobulin receptor (PIGR, Accession NM_002644.1) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with PIGR.

[25594] Peptidylprolyl isomerase d (cyclophilin d) (PPID, Accession NM_005038.1) is another GAM161 target gene, herein designated TARGET GENE. PPID BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PPID, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPID BINDING SITE, designated SEQ ID:9646, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25595] Another function of GAM161 is therefore inhibition of Peptidylprolyl isomerase d (cyclophilin d) (PPID, Accession NM_005038.1), a gene which catalyzes the cis- trans isomerization of proline imidic peptide bonds in oligopeptides. Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPID.

[25596] The function of PPID and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM136.1.Protein kinase, interferon-inducible double stranded rna dependent (PRKR, Accession NM_002759.1)

is another GAM161 target gene, herein designated TARGET GENE. PRKR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRKR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRKR BINDING SITE, designated SEQ ID:5680, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25597] Another function of GAM161 is therefore inhibition of Protein kinase, interferon-inducible double stranded rna dependent (PRKR, Accession NM_002759.1), a gene which catalyze the phosphorylation of the alpha subunit of eif2. and therefore may be associated with Huntington's disease. Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of Huntington's disease, and of other diseases and clinical conditions associated with PRKR.

[25598] The function of PRKR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM136.1.PRO0902 (Accession NM_053057.2) is another GAM161 target gene, herein designated TARGET

GENE. PRO0902 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PRO0902, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO0902 BINDING SITE, designated SEQ ID:6546, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25599] Another function of GAM161 is therefore inhibition of PRO0902 (Accession NM_053057.2) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0902.

[25600] Rab39, member ras oncogene family (RAB39, Accession XM_084662.2) is another GAM161 target gene, herein designated TARGET GENE. RAB39 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by RAB39, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAB39 BINDING SITE, designated SEQ ID:10258, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ

ID:304.

[25601] Another function of GAM161 is therefore inhibition of Rab39, member ras oncogene family (RAB39, Accession XM_084662.2) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB39.

[25602] RAP140 (Accession NM_015224.1) is another GAM161 target gene, herein designated TARGET GENE. RAP140 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAP140, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAP140 BINDING SITE, designated SEQ ID:2756, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25603] Another function of GAM161 is therefore inhibition of RAP140 (Accession NM_015224.1) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP140.

[25604] Rhesus blood group, d antigen (RHD, Accession NM_016225.2) is another GAM161 target gene, herein

designated TARGET GENE. RHD BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RHD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RHD BINDING SITE, designated SEQ ID:10256, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25605] Another function of GAM161 is therefore inhibition of Rhesus blood group, d antigen (RHD, Accession NM_016225.2), a gene which Major antigen of the RH system. Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RHD.

[25606] The function of RHD has been established by previous studies. Bennett et al. (1993) demonstrated that DNA testing can be used to determine RhD type in chorionic villus samples or amniotic cells. An RhD- negative woman whose partner is heterozygous may have preexisting anti-RhD antibodies that may or may not affect a subsequent fetus, depending on whether it is heterozygous. A safe method of determining fetal RhD type early in pregnancy

would eliminate the risks to an RhD- negative fetus of fetal blood sampling or serial amniocenteses. Levine et al. (1941) showed that hemolytic disease of the fetus occurs in an RhD- positive fetus carried by an RhD- negative woman who has been immunized by transplacental passage of RhD- positive red cells during a previous pregnancy. When the father of the fetus being carried by a sensitized RhD- negative woman is heterozygous for RhD, as more than 50% of people are, half the fetuses will be RhD- negative and therefore require no treatment to avoid erythroblastosis fetalis. The others will be RhD- positive and require sophisticated investigative measures and treatments. Lo et al. (1998) described a noninvasive method of determining fetal RhD status by analyzing maternal plasma. Using a fluorescent- based PCR assay that was sensitive enough to detect the amount of RhD DNA found in a single cell, they determined the RhD status of singleton fetuses from 57 RhD- negative women whose partners were heterozygous for the RhD gene. This method correctly identified the RhD status of 10 of 12 fetuses whose mothers were in their first trimester of pregnancy, that of all 30 fetuses whose mothers were in their second trimester, and that of all 15 fetuses whose moth-

ers were in their third trimester. The method they described was rapid, providing results within 1 day, and represented a major advance in RhD genotyping.

[25607]

[25608] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25609] Bennett, P. R.; Le Van Kim, C.; Colin, Y.; Warwick, R. M.; Cherif- Zahar, B.; Fisk, N. M.; Cartron, J.- P. : Prenatal determination of fetal RhD type by DNA amplification. New Eng. J. Med. 329: 607- 610, 1993. ; and

[25610] Lo, Y. M. D.; Hjelm, N. M.; Fidler, C.; Sargent, I. L.; Murphy, M. F.; Chamberlain, P. F.; Poon, P. M. K.; Redman, C. W. G.; Wainscoat, J. S. : Prenatal diagnosis of fetal RhD status by mol.

[25611] Further studies establishing the function and utilities of RHD are found in John Hopkins OMIM database record ID 111680, and in cited publications listed in Table 5, which are hereby incorporated by reference.Sh3-domain binding protein 2 (SH3BP2, Accession NM_003023.2) is another GAM161 target gene, herein designated TARGET GENE. SH3BP2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SH3BP2, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SH3BP2 BINDING SITE, designated SEQ ID:12256, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25612] Another function of GAM161 is therefore inhibition of Sh3-domain binding protein 2 (SH3BP2, Accession NM_003023.2) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BP2.

[25613] Short stature homeobox (SHOX, Accession) is another GAM161 target gene, herein designated TARGET GENE. SHOX BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SHOX, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SHOX BINDING SITE, designated SEQ ID:4418, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25614] Another function of GAM161 is therefore inhibition of Short stature homeobox (SHOX, Accession) . Accordingly,

utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHOX.

[25615] Synaptosomal-associated protein, 23kda (SNAP23, Accession NM_003825.2) is another GAM161 target gene, herein designated TARGET GENE. SNAP23 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SNAP23, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SNAP23 BINDING SITE, designated SEQ ID:5601, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25616] Another function of GAM161 is therefore inhibition of Synaptosomal-associated protein, 23kda (SNAP23, Accession NM_003825.2), a gene which is essential component of the high affinity receptor for the general membrane fusion machinery. Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNAP23.

[25617] The function of SNAP23 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to GAM30.1.Sorting nexin 15 (SNX15, Accession NM_013306.2) is another GAM161 target gene, herein designated TARGET GENE. SNX15 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SNX15, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SNX15 BINDING SITE, designated SEQ ID:19041, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25618] Another function of GAM161 is therefore inhibition of Sorting nexin 15 (SNX15, Accession NM_013306.2) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX15.

[25619] STAF65(gamma) (Accession NM_014860.1) is another GAM161 target gene, herein designated TARGET GENE. STAF65(gamma) BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by STAF65(gamma), corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STAF65(gamma) BINDING SITE, designated SEQ ID:18839, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25620] Another function of GAM161 is therefore inhibition of STAF65(gamma) (Accession NM_014860.1) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAF65(gamma).

[25621] Tap binding protein (tapasin) (TAPBP, Accession NM_003190.3) is another GAM161 target gene, herein designated TARGET GENE. TAPBP BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by TAPBP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TAPBP BINDING SITE, designated SEQ ID:9641, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25622] Another function of GAM161 is therefore inhibition of Tap binding protein (tapasin) (TAPBP, Accession

NM_003190.3), a gene which is involved in MHC class I-restricted antigen processing. Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAPBP.

[25623] The function of TAPBP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM136.1.Transcription factor 2, hepatic; lf-b3; variant hepatic nuclear factor (TCF2, Accession NM_000458.1) is another GAM161 target gene, herein designated TARGET GENE. TCF2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TCF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TCF2 BINDING SITE, designated SEQ ID:4621, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25624] Another function of GAM161 is therefore inhibition of Transcription factor 2, hepatic; lf-b3; variant hepatic nuclear factor (TCF2, Accession NM_000458.1), a gene which probably binds to the inverted palindrome 5'- gttaatnat-

taac- 3'. and therefore is associated with Maturity- onset diabetes of the young type 5 (mody5), familial hypoplastic glomerulocystic kidney disease (gckd). Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of Maturity- onset diabetes of the young type 5 (mody5), familial hypoplastic glomerulocystic kidney disease (gckd), and of other diseases and clinical conditions associated with TCF2.

[25625] The function of TCF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM144.1.Teratocarcinoma-derived growth factor 1 (TDGF1, Accession NM_003212.1) is another GAM161 target gene, herein designated TARGET GENE. TDGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TDGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TDGF1 BINDING SITE, designated SEQ ID:2312, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25626] Another function of GAM161 is therefore inhibition of

Teratocarcinoma-derived growth factor 1 (TDGF1, Accession NM_003212.1), a gene which can play a role in the determination of the epiblastic cells that subsequently give rise to the mesoderm. and therefore may be associated with Forebrain defects. Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of Forebrain defects, and of other diseases and clinical conditions associated with TDGF1.

[25627] The function of TDGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Tgfb-induced factor 2 (tale family homeobox) (TGIF2, Accession NM_021809.2) is another GAM161 target gene, herein designated TARGET GENE. TGIF2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TGIF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TGIF2 BINDING SITE, designated SEQ ID:14237, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25628] Another function of GAM161 is therefore inhibition of

Tgfb-induced factor 2 (tale family homeobox) (TGIF2, Accession NM_021809.2) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGIF2.

[25629] Tnf receptor-associated factor 5 (TRAF5, Accession NM_004619.2) is another GAM161 target gene, herein designated TARGET GENE. TRAF5 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by TRAF5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRAF5 BINDING SITE, designated SEQ ID:1063, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25630] Another function of GAM161 is therefore inhibition of Tnf receptor-associated factor 5 (TRAF5, Accession NM_004619.2), a gene which Member of a family of proteins that interact with TNF receptors; binds the lymphotoxin beta receptor (LTBR). Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAF5.

[25631] The function of TRAF5 and its association with various

diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM69.2.Transient receptor potential cation channel, subfamily m, member 6 (TRPM6, Accession NM_017662.3) is another GAM161 target gene, herein designated TARGET GENE. TRPM6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TRPM6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRPM6 BINDING SITE, designated SEQ ID:12681, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25632] Another function of GAM161 is therefore inhibition of Transient receptor potential cation channel, subfamily m, member 6 (TRPM6, Accession NM_017662.3), a gene which contains a predicted ion channel domain and a protein kinase domain. and therefore is associated with Hypomagnesemia with secondary hypocalcemia. Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of Hypomagnesemia with secondary hypocalcemia, and of other diseases and clinical condi-

tions associated with TRPM6.

[25633] The function of TRPM6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM130.1.Vent-like homeobox 2 (VENTX2, Accession NM_014468.1) is another GAM161 target gene, herein designated TARGET GENE. VENTX2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by VENTX2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VENTX2 BINDING SITE, designated SEQ ID:17401, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25634] Another function of GAM161 is therefore inhibition of Vent-like homeobox 2 (VENTX2, Accession NM_014468.1) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VENTX2.

[25635] Wolf-hirschhorn syndrome candidate 1 (WHSC1, Accession NM_133332.1) is another GAM161 target gene, herein designated TARGET GENE. WHSC1 BINDING SITE is a

target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by WHSC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WHSC1 BINDING SITE, designated SEQ ID:18202, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25636] Another function of GAM161 is therefore inhibition of Wolf-hirschhorn syndrome candidate 1 (WHSC1, Accession NM_133332.1), a gene which binds covalently to and repairs g/t mismatches. and therefore may be associated with Wolf- hirschhorn syndrome. Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of Wolf- hirschhorn syndrome, and of other diseases and clinical conditions associated with WHSC1.

[25637] The function of WHSC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Zinc finger protein 253 (ZNF253, Accession NM_021047.1) is another GAM161 target gene, herein designated TARGET GENE. ZNF253 BINDING SITE is a target binding site found in the 3` untranslated region of

mRNA encoded by ZNF253, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF253 BINDING SITE, designated SEQ ID:12566, to the nucleotide sequence of GAM161 RNA, herein designated GAM RNA, also designated SEQ ID:304.

[25638] Another function of GAM161 is therefore inhibition of Zinc finger protein 253 (ZNF253, Accession NM_021047.1) . Accordingly, utilities of GAM161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF253.

[25639]

[25640] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 162 (GAM162), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25641] GAM162 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM162 was detected is described hereinabove with reference to Figs. 8-15.

[25642] GAM162 gene, herein designated GAM GENE, and GAM162 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[25643] GAM162 gene encodes a GAM162 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM162 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM162 precursor RNA is designated SEQ ID:58, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:58 is located at position 76562126 relative to chromosome 17.

[25644] GAM162 precursor RNA folds onto itself, forming GAM162 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25645] GAM162 precursor RNA folds onto itself, forming GAM162 folded precursor RNA, herein designated GAM FOLDED

PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[25646] Nucleotide sequence of GAM162 precursor RNA, designated SEQ-ID: 58, and a schematic representation of a predicted secondary folding of GAM162 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[25647] An enzyme complex designated DICER COMPLEX, `dices` the GAM162 folded precursor RNA into GAM162 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM162 RNA is designated SEQ ID:376, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby in-

corporated by reference.

[25648] GAM162 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM162 target RNA, herein designated GAM TARGET RNA. GAM162 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25649] GAM162 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM162 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM162 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM162 RNA may have a different number of target binding sites in untranslated regions of a GAM162 target RNA. It is further appreciated that while Fig. 8 depicts tar-

get binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25650] The complementary binding of GAM162 RNA, herein designated GAM RNA, to target binding sites on GAM162 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM162 target RNA into GAM162 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25651] It is appreciated that GAM162 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM162 target genes. The mRNA of each one of this plurality of GAM162 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM162 RNA, herein designated GAM RNA, and which when bound by GAM162 RNA causes inhibition of translation of respective one or more GAM162 target proteins.

[25652] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by

GAM162 gene, herein designated GAM GENE, on one or more GAM162 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25653] It is appreciated that specific functions and accordingly utilities of GAM162 correlate with, and may be deduced from, the identity of the target genes which GAM162 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25654]

[25655]

[25656] KIAA1582 (Accession XM_037262.4) is a GAM162 target gene, herein designated TARGET GENE. KIAA1582 BIND-

ING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1582, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1582 BINDING SITE, designated SEQ ID:12216, to the nucleotide sequence of GAM162 RNA, herein designated GAM RNA, also designated SEQ ID:376.

[25657] A function of GAM162 is therefore inhibition of KIAA1582 (Accession XM_037262.4) . Accordingly, utilities of GAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1582.

[25658] VRP (Accession NM_007063.1) is another GAM162 target gene, herein designated TARGET GENE. VRP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by VRP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VRP BINDING SITE, designated SEQ ID:11972, to the nucleotide sequence of GAM162 RNA, herein designated GAM RNA, also designated SEQ ID:376.

[25659] Another function of GAM162 is therefore inhibition of VRP (Accession NM_007063.1) . Accordingly, utilities of GAM162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VRP.

[25660]

[25661] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 163 (GAM163), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25662] GAM163 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM163 was detected is described hereinabove with reference to Figs. 8-15.

[25663] GAM163 gene, herein designated GAM GENE, and GAM163 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[25664] GAM163 gene encodes a GAM163 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM163 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of

GAM163 precursor RNA is designated SEQ ID:84, and is provided hereinbelow with reference to the sequence listing part.

[25665] GAM163 precursor RNA folds onto itself, forming GAM163 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25666] GAM163 precursor RNA folds onto itself, forming GAM163 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[25667] Nucleotide sequence of GAM163 precursor RNA, designated SEQ-ID: 84, and a schematic representation of a

predicted secondary folding of GAM163 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[25668] An enzyme complex designated DICER COMPLEX, `dices` the GAM163 folded precursor RNA into GAM163 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM163 RNA is designated SEQ ID:249, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[25669] GAM163 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM163 target RNA, herein designated GAM TARGET RNA. GAM163 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25670] GAM163 RNA, herein designated GAM RNA, binds com-

plementarily to one or more target binding sites located in untranslated regions of GAM163 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM163 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM163 RNA may have a different number of target binding sites in untranslated regions of a GAM163 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25671] The complementary binding of GAM163 RNA, herein designated GAM RNA, to target binding sites on GAM163 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM163 target RNA into GAM163 tar-

get protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25672] It is appreciated that GAM163 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM163 target genes. The mRNA of each one of this plurality of GAM163 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM163 RNA, herein designated GAM RNA, and which when bound by GAM163 RNA causes inhibition of translation of respective one or more GAM163 target proteins.

[25673] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM163 gene, herein designated GAM GENE, on one or more GAM163 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other

genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25674] It is appreciated that specific functions and accordingly utilities of GAM163 correlate with, and may be deduced from, the identity of the target genes which GAM163 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25675]

[25676]

[25677] Endothelial differentiation, g-protein-coupled receptor 6 (EDG6, Accession NM_003775.1) is a GAM163 target gene, herein designated TARGET GENE. EDG6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EDG6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EDG6 BINDING SITE, designated SEQ ID:859, to the nucleotide sequence of GAM163 RNA, herein designated GAM RNA, also designated SEQ ID:249.

[25678] A function of GAM163 is therefore inhibition of Endothelial differentiation, g-protein-coupled receptor 6 (EDG6, Accession NM_003775.1), a gene which may act as a receptor for a trophic factor and is involved in the survival of brain cells. Accordingly, utilities of GAM163 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDG6.

[25679] The function of EDG6 has been established by previous studies. By PCR with degenerate oligonucleotides derived from regions conserved among GPCRs, Graler et al. (1998) cloned differentiated dendritic cell cDNAs encoding EDG6. The predicted 384- amino acid EDG6 protein has 7 transmembrane domains. The EDG6 protein shares 82% sequence identity with mouse Edg6, 46% identity with human EDG3 (OMIM Ref. No. 601965), 44% identity with human EDG1, 39% identity with human EDG4 (OMIM Ref. No. 605110), and 37% identity with human EDG2. Northern blot analysis indicated that EDG6 is expressed as a 1.7-kb transcript in fetal and adult lymphoid and hematopoietic tissues, lung, and Burkitt lymphoma cell lines. Graler et al. (1998) noted that the 3- prime end of their EDG6 cDNA is identical to a short sequence encompassing the dinucleotide repeat polymorphism D19S120 (GenBank

X65642), which was assigned to 19p13.3 by Jedlicka et al. (1994). By PCR of human genomic DNA using a gene-specific primer to EDG6 and a primer to the D19S120 amplicon, Graler et al. (1998) localized the EDG6 gene to 19p13.3.

[25680]

[25681] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25682] Graler, M. H.; Bernhardt, G.; Lipp, M. : EDG6, a novel G-protein- coupled receptor related to receptors for bioactive lysophospholipids, is specifically expressed in lymphoid tissue. Genomics 53: 164- 169, 1998. ; and

[25683] Jedlicka, A. E.; Taylor, E. W.; Meyers, D. A.; Liu, Z.; Levitt, R. C. : Localization of the highly polymorphic locus D19S120 to 19p13.3 by linkage. Cytogenet. Cell. Genet. 65: 140 only.

[25684] Further studies establishing the function and utilities of EDG6 are found in John Hopkins OMIM database record ID 603751, and in cited publications listed in Table 5, which are hereby incorporated by reference.LOC112868 (Accession XM_053402.4) is another GAM163 target gene, herein designated TARGET GENE. LOC112868 BINDING

SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC112868, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC112868 BINDING SITE, designated SEQ ID:17580, to the nucleotide sequence of GAM163 RNA, herein designated GAM RNA, also designated SEQ ID:249.

[25685] Another function of GAM163 is therefore inhibition of LOC112868 (Accession XM_053402.4) . Accordingly, utilities of GAM163 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112868.

[25686] Oligodendrocyte lineage transcription factor 2 (OLIG2, Accession NM_005806.1) is another GAM163 target gene, herein designated TARGET GENE. OLIG2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by OLIG2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OLIG2 BINDING SITE, designated SEQ ID:18460, to the nucleotide sequence of GAM163 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:249.

[25687] Another function of GAM163 is therefore inhibition of Oligodendrocyte lineage transcription factor 2 (OLIG2, Accession NM_005806.1), a gene which may bind DNA and contains a helix- loop- helix DNA- binding domain. Accordingly, utilities of GAM163 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OLIG2.

[25688] The function of OLIG2 has been established by previous studies. The oligodendrocyte lineage transcription factors OLIG1 (OMIM Ref. No. 606385) and OLIG2, originally identified in rodents, encode basic helix- loop- helix transcription factors. In the rodent central nervous system, they are expressed exclusively in oligodendrocytes and oligodendrocyte precursors (Lu et al., 2000; Zhou et al., 2000). Pursuing the suggestion that novel molecular markers might be found among factors that have roles in glial development (Raff et al., 1983), Lu et al. (2001) found that the human OLIG1/2 genes are expressed strongly in oligodendroglioma, contrasting absent or low expression in astrocytoma. Their study provided evidence that neoplastic cells of oligodendroglioma resemble oligodendrocytes or their progenitor cells and may derive

from cells of this lineage.

[25689] Animal model experiments lend further support to the function of OLIG2. In Olig1/2 double- mutant mice, Zhou and Anderson (2002) found that motoneurons were largely eliminated, and oligodendrocyte differentiation was abolished. Lineage tracing data suggested that Olig1/2 - /- pMN progenitors instead generated V2 interneurons and then astrocytes. This apparent conversion likely reflects independent roles for OLIG1/2 in specifying motoneuron and oligodendrocyte fates. OLIG genes therefore couple neuronal and glial subtype specification, unlike proneural bHLH factors that control the neuron versus glia decision. The authors concluded that, in the spinal cord, OLIG and proneural genes comprise a combinatorial code for the specification of neurons, astrocytes, and oligodendrocytes, the 3 fundamental cell types of the central nervous system.

[25690] It is appreciated that the abovementioned animal model for OLIG2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[25691] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[25692] Lu, Q. R.; Park, J. K.; Noll, E.; Chan, J. A.; Alberta, J.; Yuk, D.; Alzamora, M. G.; Louis, D. N.; Stiles, C. D.; Rowitch, D. H.; Black, P. M. : Oligodendrocyte lineage genes (OLIG) as molecular markers for human glial brain tumors. Proc. Nat. Acad. Sci. 98: 10851- 10856, 2001. ; and

[25693] Zhou, Q.; Anderson, D. J. : The bHLH transcription factors OLIG2 and OLIG1 couple neuronal and glial subtype specification. Cell 109: 61- 73, 2002.

[25694] Further studies establishing the function and utilities of OLIG2 are found in John Hopkins OMIM database record ID 606386, and in cited publications listed in Table 5, which are hereby incorporated by reference.Phosphatase and tensin homolog (mutated in multiple advanced cancers 1) (PTEN, Accession NM_000314.1) is another GAM163 target gene, herein designated TARGET GENE. PTEN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PTEN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTEN BINDING SITE, designated SEQ ID:2919, to the nucleotide sequence of GAM163 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:249.

[25695] Another function of GAM163 is therefore inhibition of Phosphatase and tensin homolog (mutated in multiple advanced cancers 1) (PTEN, Accession NM_000314.1) . Accordingly, utilities of GAM163 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTEN.

[25696]

[25697] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 164 (GAM164), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25698] GAM164 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM164 was detected is described hereinabove with reference to Figs. 8-15.

[25699] GAM164 gene, herein designated GAM GENE, and GAM164 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[25700] GAM164 gene encodes a GAM164 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA

genes, and unlike most ordinary genes, GAM164 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM164 precursor RNA is designated SEQ ID:66, and is provided hereinbelow with reference to the sequence listing part.

[25701] GAM164 precursor RNA folds onto itself, forming GAM164 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25702] GAM164 precursor RNA folds onto itself, forming GAM164 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nu-

cleotide sequence of the second half thereof.

[25703] Nucleotide sequence of GAM164 precursor RNA, designated SEQ-ID: 66, and a schematic representation of a predicted secondary folding of GAM164 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[25704] An enzyme complex designated DICER COMPLEX, `dices` the GAM164 folded precursor RNA into GAM164 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM164 RNA is designated SEQ ID:322, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[25705] GAM164 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM164 target RNA, herein designated GAM TARGET RNA. GAM164 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein

coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25706] GAM164 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM164 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM164 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM164 RNA may have a different number of target binding sites in untranslated regions of a GAM164 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25707] The complementary binding of GAM164 RNA, herein designated GAM RNA, to target binding sites on GAM164 tar-

get RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM164 target RNA into GAM164 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25708] It is appreciated that GAM164 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM164 target genes. The mRNA of each one of this plurality of GAM164 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM164 RNA, herein designated GAM RNA, and which when bound by GAM164 RNA causes inhibition of translation of respective one or more GAM164 target proteins.

[25709] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM164 gene, herein designated GAM GENE, on one or more GAM164 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the

known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25710] It is appreciated that specific functions and accordingly utilities of GAM164 correlate with, and may be deduced from, the identity of the target genes which GAM164 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25711]

[25712]

[25713] FLJ21986 (Accession NM_024913.1) is a GAM164 target gene, herein designated TARGET GENE. FLJ21986 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ21986, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21986 BINDING SITE, designated SEQ ID:11076, to the nucleotide

sequence of GAM164 RNA, herein designated GAM RNA, also designated SEQ ID:322.

[25714] A function of GAM164 is therefore inhibition of FLJ21986 (Accession NM_024913.1) . Accordingly, utilities of GAM164 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21986.

[25715] Lipase, member i (LIPI, Accession) is another GAM164 target gene, herein designated TARGET GENE. LIPI BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LIPI, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LIPI BINDING SITE, designated SEQ ID:15797, to the nucleotide sequence of GAM164 RNA, herein designated GAM RNA, also designated SEQ ID:322.

[25716] Another function of GAM164 is therefore inhibition of Lipase, member i (LIPI, Accession) . Accordingly, utilities of GAM164 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIPI.

[25717]

[25718] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, re-

ferred to here as Genomic Address Messenger 165 (GAM165), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25719] GAM165 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM165 was detected is described hereinabove with reference to Figs. 8-15.

[25720] GAM165 gene, herein designated GAM GENE, and GAM165 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[25721] GAM165 gene encodes a GAM165 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM165 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM165 precursor RNA is designated SEQ ID:134, and is provided hereinbelow with reference to the sequence listing part.

[25722] GAM165 precursor RNA folds onto itself, forming GAM165 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin struc-

ture`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25723] GAM165 precursor RNA folds onto itself, forming GAM165 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[25724] Nucleotide sequence of GAM165 precursor RNA, designated SEQ-ID: 134, and a schematic representation of a predicted secondary folding of GAM165 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[25725] An enzyme complex designated DICER COMPLEX, `dices` the GAM165 folded precursor RNA into GAM165 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM165 RNA is designated SEQ ID:270, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[25726] GAM165 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM165 target RNA, herein designated GAM TARGET RNA. GAM165 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25727] GAM165 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM165 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM165 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such

target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM165 RNA may have a different number of target binding sites in untranslated regions of a GAM165 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25728] The complementary binding of GAM165 RNA, herein designated GAM RNA, to target binding sites on GAM165 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM165 target RNA into GAM165 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25729] It is appreciated that GAM165 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM165 target genes. The mRNA of each one of this plurality of GAM165 target genes comprises one or more target binding sites, each having a nucleotide sequence

which is at least partly complementary to GAM165 RNA, herein designated GAM RNA, and which when bound by GAM165 RNA causes inhibition of translation of respective one or more GAM165 target proteins.

[25730] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM165 gene, herein designated GAM GENE, on one or more GAM165 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25731] It is appreciated that specific functions and accordingly utilities of GAM165 correlate with, and may be deduced from, the identity of the target genes which GAM165

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25732]

[25733]

[25734] Ras homolog gene family, member c (ARHC, Accession NM_175744.1) is a GAM165 target gene, herein designated TARGET GENE. ARHC BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ARHC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARHC BINDING SITE, designated SEQ ID:15644, to the nucleotide sequence of GAM165 RNA, herein designated GAM RNA, also designated SEQ ID:270.

[25735] A function of GAM165 is therefore inhibition of Ras homolog gene family, member c (ARHC, Accession NM_175744.1), a gene which remodels of the actin cytoskeleton during cell morphogenesis and motility. and therefore may be associated with Metastatic melanoma. Accordingly, utilities of GAM165 include diagnosis, prevention and treatment of Metastatic melanoma., and of

other diseases and clinical conditions associated with ARHC.

[25736] The function of ARHC has been established by previous studies. The small guanosine triphosphatase Rho regulates remodeling of the actin cytoskeleton during cell morphogenesis and motility. In their Figure 3C, Maekawa et al. (1999) diagrammed proposed signaling pathways for Rho- induced remodeling of the actin cytoskeleton. They demonstrated that active Rho signals to its downstream effector ROCK (OMIM Ref. No. 601702), which phosphorylates and activates LIM kinase (see OMIM Ref. No. 601329). LIM kinase, in turn, phosphorylates cofilin (OMIM Ref. No. 601442), inhibiting its actin- depolymerizing activity. Clark et al. (2000) used an in vivo selection scheme to select highly metastatic melanoma cells. By analyzing these cells on DNA arrays, they defined a pattern of gene expression that correlates with progression to a metastatic phenotype. In particular, Clark et al. (2000) showed enhanced expression of several genes involved in extracellular matrix assembly and of a second set of genes that regulate, either directly or indirectly, the actin-based cytoskeleton. Clark et al. (2000) found that RhoC enhances metastasis when overexpressed, whereas a

dominant- negative Rho inhibits metastasis. Analysis of the phenotype of cells expressing dominant- negative Rho or RhoC indicates that RhoC is important in tumor cell invasion. The genomic approach allowed Clark et al. (2000) to identify families of genes involved in a process, not just single genes, and could indicate which molecular and cellular events might be important in complex biologic processes such as metastasis.

[25737]

[25738] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25739] Clark, E. A.; Golub, T. R.; Lander, E. S.; Hynes, R. O. : Genomic analysis of metastasis reveals an essential role for RhoC. Nature 406: 532- 535, 2000. ; and

[25740] Maekawa, M.; Ishizaki, T.; Boku, S.; Watanabe, N.; Fujita, A.; Iwamatsu, A.; Obinata, T.; Ohashi, K.; Mizuno, K.; Narumiya, S. : Signaling from Rho to the actin cytoskeleton through pro.

[25741] Further studies establishing the function and utilities of ARHC are found in John Hopkins OMIM database record ID 165380, and in cited publications listed in Table 5, which are hereby incorporated by reference.BNIP-S (Accession

NM_138278.1) is another GAM165 target gene, herein designated TARGET GENE. BNIP-S BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by BNIP-S, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BNIP-S BINDING SITE, designated SEQ ID:1814, to the nucleotide sequence of GAM165 RNA, herein designated GAM RNA, also designated SEQ ID:270.

[25742] Another function of GAM165 is therefore inhibition of BNIP-S (Accession NM_138278.1) . Accordingly, utilities of GAM165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BNIP-S.

[25743] DKFZp434M0331 (Accession NM_017600.1) is another GAM165 target gene, herein designated TARGET GENE. DKFZp434M0331 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZp434M0331, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434M0331 BINDING SITE, designated SEQ ID:8421, to the nucleotide sequence of

GAM165 RNA, herein designated GAM RNA, also designated SEQ ID:270.

[25744] Another function of GAM165 is therefore inhibition of DKFZp434M0331 (Accession NM_017600.1) . Accordingly, utilities of GAM165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434M0331.

[25745] FLJ14728 (Accession) is another GAM165 target gene, herein designated TARGET GENE. FLJ14728 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ14728, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14728 BINDING SITE, designated SEQ ID:9157, to the nucleotide sequence of GAM165 RNA, herein designated GAM RNA, also designated SEQ ID:270.

[25746] Another function of GAM165 is therefore inhibition of FLJ14728 (Accession) . Accordingly, utilities of GAM165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14728.

[25747] KIAA1969 (Accession) is another GAM165 target gene, herein designated TARGET GENE. KIAA1969 BINDING SITE

is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1969, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1969 BINDING SITE, designated SEQ ID:12294, to the nucleotide sequence of GAM165 RNA, herein designated GAM RNA, also designated SEQ ID:270.

[25748] Another function of GAM165 is therefore inhibition of KIAA1969 (Accession) . Accordingly, utilities of GAM165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1969.

[25749] LOC199777 (Accession NM_145297.1) is another GAM165 target gene, herein designated TARGET GENE. LOC199777 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC199777, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC199777 BINDING SITE, designated SEQ ID:16714, to the nucleotide sequence of GAM165 RNA, herein designated GAM RNA, also designated SEQ ID:270.

[25750] Another function of GAM165 is therefore inhibition of

LOC199777 (Accession NM_145297.1) . Accordingly, utilities of GAM165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199777.

[25751] LOC199906 (Accession XM_114052.1) is another GAM165 target gene, herein designated TARGET GENE. LOC199906 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC199906, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC199906 BINDING SITE, designated SEQ ID:18302, to the nucleotide sequence of GAM165 RNA, herein designated GAM RNA, also designated SEQ ID:270.

[25752] Another function of GAM165 is therefore inhibition of LOC199906 (Accession XM_114052.1) . Accordingly, utilities of GAM165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199906.

[25753] MGC20460 (Accession NM_053043.1) is another GAM165 target gene, herein designated TARGET GENE. MGC20460 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC20460, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC20460 BINDING SITE, designated SEQ ID:17732, to the nucleotide sequence of GAM165 RNA, herein designated GAM RNA, also designated SEQ ID:270.

[25754] Another function of GAM165 is therefore inhibition of MGC20460 (Accession NM_053043.1) . Accordingly, utilities of GAM165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20460.

[25755] Transducin (beta)-like 1x-linked (TBL1X, Accession NM_005647.2) is another GAM165 target gene, herein designated TARGET GENE. TBL1X BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TBL1X, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TBL1X BINDING SITE, designated SEQ ID:11582, to the nucleotide sequence of GAM165 RNA, herein designated GAM RNA, also designated SEQ ID:270.

[25756] Another function of GAM165 is therefore inhibition of

Transducin (beta)-like 1x-linked (TBL1X, Accession NM_005647.2), a gene which activates latent HDAC3 activity. Accordingly, utilities of GAM165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBL1X.

[25757] The function of TBL1X and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM28.1.

[25758] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 166 (GAM166), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25759] GAM166 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM166 was detected is described hereinabove with reference to Figs. 8-15.

[25760] GAM166 gene, herein designated GAM GENE, and GAM166 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[25761] GAM166 gene encodes a GAM166 precursor RNA, herein

designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM166 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM166 precursor RNA is designated SEQ ID:161, and is provided hereinbelow with reference to the sequence listing part.

[25762] GAM166 precursor RNA folds onto itself, forming GAM166 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25763] GAM166 precursor RNA folds onto itself, forming GAM166 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate

or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[25764] Nucleotide sequence of GAM166 precursor RNA, designated SEQ-ID: 161, and a schematic representation of a predicted secondary folding of GAM166 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[25765] An enzyme complex designated DICER COMPLEX, `dices` the GAM166 folded precursor RNA into GAM166 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM166 RNA is designated SEQ ID:232, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[25766] GAM166 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM166 target RNA, herein designated GAM TARGET RNA. GAM166 target RNA comprises three regions, as is typical of mRNA of

a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25767] GAM166 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM166 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM166 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM166 RNA may have a different number of target binding sites in untranslated regions of a GAM166 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25768] The complementary binding of GAM166 RNA, herein des-

ignated GAM RNA, to target binding sites on GAM166 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM166 target RNA into GAM166 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25769] It is appreciated that GAM166 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM166 target genes. The mRNA of each one of this plurality of GAM166 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM166 RNA, herein designated GAM RNA, and which when bound by GAM166 RNA causes inhibition of translation of respective one or more GAM166 target proteins.

[25770] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM166 gene, herein designated GAM GENE, on one or more GAM166 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary bind-

ing site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25771] It is appreciated that specific functions and accordingly utilities of GAM166 correlate with, and may be deduced from, the identity of the target genes which GAM166 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25772]

[25773]

[25774] MGC13198 (Accession) is a GAM166 target gene, herein designated TARGET GENE. MGC13198 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC13198, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC13198

BINDING SITE, designated SEQ ID:1875, to the nucleotide sequence of GAM166 RNA, herein designated GAM RNA, also designated SEQ ID:232.

[25775] A function of GAM166 is therefore inhibition of MGC13198 (Accession) . Accordingly, utilities of GAM166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13198.

[25776] NEBL (Accession NM_006393.1) is another GAM166 target gene, herein designated TARGET GENE. NEBL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NEBL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NEBL BINDING SITE, designated SEQ ID:6830, to the nucleotide sequence of GAM166 RNA, herein designated GAM RNA, also designated SEQ ID:232.

[25777] Another function of GAM166 is therefore inhibition of NEBL (Accession NM_006393.1) . Accordingly, utilities of GAM166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEBL.

[25778]

[25779] Fig. 8 further provides a conceptual description of a novel

bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 167 (GAM167), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25780] GAM167 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM167 was detected is described hereinabove with reference to Figs. 8-15.

[25781] GAM167 gene, herein designated GAM GENE, and GAM167 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[25782] GAM167 gene encodes a GAM167 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM167 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM167 precursor RNA is designated SEQ ID:140, and is provided hereinbelow with reference to the sequence listing part.

[25783] GAM167 precursor RNA folds onto itself, forming GAM167 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25784] GAM167 precursor RNA folds onto itself, forming GAM167 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[25785] Nucleotide sequence of GAM167 precursor RNA, designated SEQ-ID: 140, and a schematic representation of a predicted secondary folding of GAM167 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[25786] An enzyme complex designated DICER COMPLEX, `dices` the GAM167 folded precursor RNA into GAM167 RNA, herein designated GAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM167 RNA is designated SEQ ID:236, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[25787] GAM167 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM167 target RNA, herein designated GAM TARGET RNA. GAM167 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25788] GAM167 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM167 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM167 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target

binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM167 RNA may have a different number of target binding sites in untranslated regions of a GAM167 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25789] The complementary binding of GAM167 RNA, herein designated GAM RNA, to target binding sites on GAM167 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM167 target RNA into GAM167 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25790] It is appreciated that GAM167 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM167 target genes. The mRNA of each one of this plurality of GAM167 target genes comprises one or more tar-

get binding sites, each having a nucleotide sequence which is at least partly complementary to GAM167 RNA, herein designated GAM RNA, and which when bound by GAM167 RNA causes inhibition of translation of respective one or more GAM167 target proteins.

[25791] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM167 gene, herein designated GAM GENE, on one or more GAM167 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25792] It is appreciated that specific functions and accordingly utilities of GAM167 correlate with, and may be deduced

from, the identity of the target genes which GAM167 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25793]

[25794]

[25795] Kruppel-like factor 12 (KLF12, Accession NM_007249.3) is a GAM167 target gene, herein designated TARGET GENE. KLF12 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KLF12, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KLF12 BINDING SITE, designated SEQ ID:14666, to the nucleotide sequence of GAM167 RNA, herein designated GAM RNA, also designated SEQ ID:236.

[25796] A function of GAM167 is therefore inhibition of Kruppel-like factor 12 (KLF12, Accession NM_007249.3) . Accordingly, utilities of GAM167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLF12.

[25797] LOC131873 (Accession XM_067585.7) is another GAM167

target gene, herein designated TARGET GENE. LOC131873 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC131873, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC131873 BINDING SITE, designated SEQ ID:11445, to the nucleotide sequence of GAM167 RNA, herein designated GAM RNA, also designated SEQ ID:236.

[25798] Another function of GAM167 is therefore inhibition of LOC131873 (Accession XM_067585.7) . Accordingly, utilities of GAM167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131873.

[25799] LOC63929 (Accession NM_022098.1) is another GAM167 target gene, herein designated TARGET GENE. LOC63929 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC63929, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC63929 BINDING SITE, designated SEQ ID:17904, to the nucleotide sequence of GAM167 RNA, herein designated

GAM RNA, also designated SEQ ID:236.

[25800] Another function of GAM167 is therefore inhibition of LOC63929 (Accession NM_022098.1) . Accordingly, utilities of GAM167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC63929.

[25801] VIT1 (Accession) is another GAM167 target gene, herein designated TARGET GENE. VIT1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by VIT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VIT1 BINDING SITE, designated SEQ ID:16317, to the nucleotide sequence of GAM167 RNA, herein designated GAM RNA, also designated SEQ ID:236.

[25802] Another function of GAM167 is therefore inhibition of VIT1 (Accession) . Accordingly, utilities of GAM167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VIT1.

[25803]

[25804] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, re-

ferred to here as Genomic Address Messenger 168 (GAM168), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25805] GAM168 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM168 was detected is described hereinabove with reference to Figs. 8-15.

[25806] GAM168 gene, herein designated GAM GENE, and GAM168 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[25807] GAM168 gene encodes a GAM168 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM168 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM168 precursor RNA is designated SEQ ID:97, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:97 is located at position 48046908 relative to chromosome 19.

[25808] GAM168 precursor RNA folds onto itself, forming GAM168 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25809] GAM168 precursor RNA folds onto itself, forming GAM168 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[25810] Nucleotide sequence of GAM168 precursor RNA, designated SEQ-ID: 97, and a schematic representation of a predicted secondary folding of GAM168 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[25811] An enzyme complex designated DICER COMPLEX, `dices` the GAM168 folded precursor RNA into GAM168 RNA, herein designated GAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM168 RNA is designated SEQ ID:217, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[25812] GAM168 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM168 target RNA, herein designated GAM TARGET RNA. GAM168 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25813] GAM168 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM168 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM168 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target

binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM168 RNA may have a different number of target binding sites in untranslated regions of a GAM168 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25814] The complementary binding of GAM168 RNA, herein designated GAM RNA, to target binding sites on GAM168 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM168 target RNA into GAM168 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25815] It is appreciated that GAM168 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM168 target genes. The mRNA of each one of this plurality of GAM168 target genes comprises one or more tar-

get binding sites, each having a nucleotide sequence which is at least partly complementary to GAM168 RNA, herein designated GAM RNA, and which when bound by GAM168 RNA causes inhibition of translation of respective one or more GAM168 target proteins.

[25816] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM168 gene, herein designated GAM GENE, on one or more GAM168 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25817] It is appreciated that specific functions and accordingly utilities of GAM168 correlate with, and may be deduced

from, the identity of the target genes which GAM168 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25818]

[25819]

[25820] LOC220930 (Accession XM_167624.3) is a GAM168 target gene, herein designated TARGET GENE. LOC220930 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC220930, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC220930 BINDING SITE, designated SEQ ID:3451, to the nucleotide sequence of GAM168 RNA, herein designated GAM RNA, also designated SEQ ID:217.

[25821] A function of GAM168 is therefore inhibition of LOC220930 (Accession XM_167624.3) . Accordingly, utilities of GAM168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220930.

[25822] PIR51 (Accession NM_006479.2) is another GAM168 target gene, herein designated TARGET GENE. PIR51 BINDING

SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PIR51, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PIR51 BINDING SITE, designated SEQ ID:14378, to the nucleotide sequence of GAM168 RNA, herein designated GAM RNA, also designated SEQ ID:217.

[25823] Another function of GAM168 is therefore inhibition of PIR51 (Accession NM_006479.2), a gene which interacts with the RAD51 recombinase protein and is involved in DNA recombination and repair. Accordingly, utilities of GAM168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIR51.

[25824] The function of PIR51 has been established by previous studies. RAD51 (OMIM Ref. No. 179617), a eukaryotic homolog of the bacterial RecA recombinase, plays a role in a variety of recombination events in the eukaryotic cell. Using a yeast 2- hybrid screen with human RAD51 as the bait, Mizuta et al. (1997) isolated mouse cDNAs corresponding to a gene that they designated Rab22. The Rab22 protein interacted with RAD51 in vitro and colocalized with RAD51 in large nuclear foci in hamster cells. Ko-

valenko et al. (1997) also used a yeast 2- hybrid screen with RAD51 as the bait and isolated a HeLa cell cDNA encoding a protein that they called PIR51 for 'protein interacting with Rad51'. The predicted PIR51 protein has 335 amino acids and a calculated pI of 9.95. The authors suggested that PIR51 is the human homolog of mouse Rab22 since the 2 proteins share 63% sequence identity. Northern blot analysis revealed that PIR51 is expressed as a 2.4- kb mRNA in human testis and thymus, and at lower levels, in colon and small intestine. Recombinant PIR51 bound RNA and single- and double- stranded DNA, and was capable of aggregating DNA. Kovalenko et al. (1997) stated that PIR51 may represent a new member of the multiprotein complexes thought to carry out homologous recombination and DNA repair in mammalian cells. By analysis of an interspecific backcross, Mizuta et al. (1997) mapped the Rab22 gene to the distal region of mouse chromosome 6. Using fluorescence in situ hybridization, Kovalenko et al. (1997) mapped the PIR51 gene to 12p13.2- p13.1, a region that shows homology of synteny with the mouse chromosome 6 segment containing the Rab22 gene.

[25825]

[25826] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25827] Kovalenko, O. V.; Golub, E. I.; Bray- Ward, P.; Ward, D. C.; Radding, C. M. : A novel nucleic acid- binding protein that interacts with human Rad51 recombinase. Nucleic Acids Res. 25: 4946- 4953, 1997. ; and

[25828] Mizuta, R.; LaSalle, J. M.; Cheng, H.- L.; Shinohara, A.; Ogawa, H.; Copeland, N.; Jenkins, N. A.; Lalande, M.; Alt, F. W. : RAB22 and RAB163/mouse BRCA2: proteins that specifically inte.

[25829] Further studies establishing the function and utilities of PIR51 are found in John Hopkins OMIM database record ID 603070, and in cited publications listed in Table 5, which are hereby incorporated by reference.Pregnancy specific beta-1-glycoprotein 4 (PSG4, Accession NM_002780.1) is another GAM168 target gene, herein designated TARGET GENE. PSG4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PSG4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide se- quences of PSG4 BINDING SITE, designated SEQ ID:12119,

to the nucleotide sequence of GAM168 RNA, herein designated GAM RNA, also designated SEQ ID:217.

[25830] Another function of GAM168 is therefore inhibition of Pregnancy specific beta-1-glycoprotein 4 (PSG4, Accession NM_002780.1), a gene which is a member of the pregnancy- specific glycoprotein (PSG) and CEA families. Accordingly, utilities of GAM168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSG4.

[25831] The function of PSG4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM99.1.Pregnancy specific beta-1-glycoprotein 7 (PSG7, Accession NM_002783.1) is another GAM168 target gene, herein designated TARGET GENE. PSG7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PSG7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PSG7 BINDING SITE, designated SEQ ID:2562, to the nucleotide sequence of GAM168 RNA, herein designated GAM RNA, also designated SEQ ID:217.

[25832] Another function of GAM168 is therefore inhibition of Pregnancy specific beta-1-glycoprotein 7 (PSG7, Accession NM_002783.1), a gene which function still unknown. Accordingly, utilities of GAM168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSG7.

[25833] The function of PSG7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.

[25834] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 169 (GAM169), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25835] GAM169 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM169 was detected is described hereinabove with reference to Figs. 8-15.

[25836] GAM169 gene, herein designated GAM GENE, and GAM169 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[25837] GAM169 gene encodes a GAM169 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM169 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM169 precursor RNA is designated SEQ ID:55, and is provided hereinbelow with reference to the sequence listing part.

[25838] GAM169 precursor RNA folds onto itself, forming GAM169 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25839] GAM169 precursor RNA folds onto itself, forming GAM169 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[25840] Nucleotide sequence of GAM169 precursor RNA, designated SEQ-ID: 55, and a schematic representation of a predicted secondary folding of GAM169 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[25841] An enzyme complex designated DICER COMPLEX, `dices` the GAM169 folded precursor RNA into GAM169 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM169 RNA is designated SEQ ID:365, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[25842] GAM169 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM169 target RNA, herein designated GAM TARGET RNA. GAM169 tar-

get RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25843] GAM169 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM169 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM169 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM169 RNA may have a different number of target binding sites in untranslated regions of a GAM169 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25844] The complementary binding of GAM169 RNA, herein designated GAM RNA, to target binding sites on GAM169 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM169 target RNA into GAM169 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25845] It is appreciated that GAM169 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM169 target genes. The mRNA of each one of this plurality of GAM169 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM169 RNA, herein designated GAM RNA, and which when bound by GAM169 RNA causes inhibition of translation of respective one or more GAM169 target proteins.

[25846] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM169 gene, herein designated GAM GENE, on one or more GAM169 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the back-

ground section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25847] It is appreciated that specific functions and accordingly utilities of GAM169 correlate with, and may be deduced from, the identity of the target genes which GAM169 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25848]

[25849]

[25850] B29 (Accession NM_031939.2) is a GAM169 target gene, herein designated TARGET GENE. B29 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by B29, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of

the nucleotide sequences of B29 BINDING SITE, designated SEQ ID:9748, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25851] A function of GAM169 is therefore inhibition of B29 (Accession NM_031939.2) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B29.

[25852] BCMP1 (Accession NM_031442.1) is another GAM169 target gene, herein designated TARGET GENE. BCMP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BCMP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BCMP1 BINDING SITE, designated SEQ ID:8815, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25853] Another function of GAM169 is therefore inhibition of BCMP1 (Accession NM_031442.1) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCMP1.

[25854] Cyclin m4 (CNNM4, Accession NM_020184.1) is another GAM169 target gene, herein designated TARGET GENE.

CNNM4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CNNM4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CNNM4 BINDING SITE, designated SEQ ID:18090, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25855] Another function of GAM169 is therefore inhibition of Cyclin m4 (CNNM4, Accession NM_020184.1) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNNM4.

[25856] Collagen, type i, alpha 1 (COL1A1, Accession NM_000088.2) is another GAM169 target gene, herein designated TARGET GENE. COL1A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by COL1A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COL1A1 BINDING SITE, designated SEQ ID:16271, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA,

also designated SEQ ID:365.

[25857] Another function of GAM169 is therefore inhibition of Collagen, type i, alpha 1 (COL1A1, Accession NM_000088.2) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL1A1.

[25858] Ferrochelatase (protoporphyria) (FECH, Accession NM_000140.1) is another GAM169 target gene, herein designated TARGET GENE. FECH BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FECH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FECH BINDING SITE, designated SEQ ID:2667, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25859] Another function of GAM169 is therefore inhibition of Ferrochelatase (protoporphyria) (FECH, Accession NM_000140.1) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FECH.

[25860] FLJ11160 (Accession) is another GAM169 target gene, herein designated TARGET GENE. FLJ11160 BINDING SITE

is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11160, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11160 BINDING SITE, designated SEQ ID:409, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25861] Another function of GAM169 is therefore inhibition of FLJ11160 (Accession) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11160.

[25862] FLJ14950 (Accession) is another GAM169 target gene, herein designated TARGET GENE. FLJ14950 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14950, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14950 BINDING SITE, designated SEQ ID:12773, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25863] Another function of GAM169 is therefore inhibition of

FLJ14950 (Accession) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14950.

[25864] Glucose-6-phosphatase, catalytic (glycogen storage disease type i, von gierke disease) (G6PC, Accession NM_000151.1) is another GAM169 target gene, herein designated TARGET GENE. G6PC BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by G6PC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of G6PC BINDING SITE, designated SEQ ID:19886, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25865] Another function of GAM169 is therefore inhibition of Glucose-6-phosphatase, catalytic (glycogen storage disease type i, von gierke disease) (G6PC, Accession NM_000151.1) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with G6PC.

[25866] HRLP5 (Accession NM_054108.1) is another GAM169 target gene, herein designated TARGET GENE. HRLP5 BIND-

ING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HRLP5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HRLP5 BINDING SITE, designated SEQ ID:7902, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25867] Another function of GAM169 is therefore inhibition of HRLP5 (Accession NM_054108.1) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRLP5.

[25868] 5-hydroxytryptamine (serotonin) receptor 3a (HTR3A, Accession NM_000869.1) is another GAM169 target gene, herein designated TARGET GENE. HTR3A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HTR3A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HTR3A BINDING SITE, designated SEQ ID:7644, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25869] Another function of GAM169 is therefore inhibition of 5-hydroxytryptamine (serotonin) receptor 3a (HTR3A, Accession NM_000869.1) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTR3A.

[25870] Iduronate 2-sulfatase (hunter syndrome) (IDS, Accession NM_000202.2) is another GAM169 target gene, herein designated TARGET GENE. IDS BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by IDS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IDS BINDING SITE, designated SEQ ID:2619, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25871] Another function of GAM169 is therefore inhibition of Iduronate 2-sulfatase (hunter syndrome) (IDS, Accession NM_000202.2) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IDS.

[25872] Potassium channel, subfamily k, member 7 (KCNK7, Accession NM_033347.1) is another GAM169 target gene,

herein designated TARGET GENE. KCNK7 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by KCNK7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNK7 BINDING SITE, designated SEQ ID:10339, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25873] Another function of GAM169 is therefore inhibition of Potassium channel, subfamily k, member 7 (KCNK7, Accession NM_033347.1) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNK7.

[25874] KIAA0630 (Accession) is another GAM169 target gene, herein designated TARGET GENE. KIAA0630 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0630, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0630 BINDING SITE, designated SEQ ID:19492, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA,

also designated SEQ ID:365.

[25875] Another function of GAM169 is therefore inhibition of KIAA0630 (Accession) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0630.

[25876] KIAA1061 (Accession XM_048786.5) is another GAM169 target gene, herein designated TARGET GENE. KIAA1061 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1061, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1061 BINDING SITE, designated SEQ ID:14654, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25877] Another function of GAM169 is therefore inhibition of KIAA1061 (Accession XM_048786.5) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1061.

[25878] KIAA1577 (Accession XM_035299.2) is another GAM169 target gene, herein designated TARGET GENE. KIAA1577 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by KIAA1577, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1577 BINDING SITE, designated SEQ ID:4142, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25879] Another function of GAM169 is therefore inhibition of KIAA1577 (Accession XM_035299.2) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1577.

[25880] Kynurenine 3-monooxygenase (kynurenine 3-hydroxylase) (KMO, Accession NM_003679.1) is another GAM169 target gene, herein designated TARGET GENE. KMO BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KMO, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KMO BINDING SITE, designated SEQ ID:6772, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25881] Another function of GAM169 is therefore inhibition of Kynurenine 3-monooxygenase (kynurenine 3-hydroxylase) (KMO, Accession NM_003679.1), a gene which may play a role in encephalic photoreception. Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KMO.

[25882] The function of KMO and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Left-right determination, factor b (LEFTB, Accession NM_020997.2) is another GAM169 target gene, herein designated TARGET GENE. LEFTB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LEFTB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LEFTB BINDING SITE, designated SEQ ID:1639, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25883] Another function of GAM169 is therefore inhibition of Left-right determination, factor b (LEFTB, Accession

NM_020997.2) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LEFTB.

[25884] LOC116211 (Accession NM_138461.1) is another GAM169 target gene, herein designated TARGET GENE. LOC116211 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC116211, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC116211 BINDING SITE, designated SEQ ID:18253, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25885] Another function of GAM169 is therefore inhibition of LOC116211 (Accession NM_138461.1) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116211.

[25886] LOC145757 (Accession XM_085227.1) is another GAM169 target gene, herein designated TARGET GENE. LOC145757 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC145757, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145757 BINDING SITE, designated SEQ ID:897, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25887] Another function of GAM169 is therefore inhibition of LOC145757 (Accession XM_085227.1) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145757.

[25888] LOC146512 (Accession) is another GAM169 target gene, herein designated TARGET GENE. LOC146512 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146512, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146512 BINDING SITE, designated SEQ ID:9963, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25889] Another function of GAM169 is therefore inhibition of LOC146512 (Accession) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with LOC146512.

[25890] LOC151124 (Accession XM_098006.2) is another GAM169 target gene, herein designated TARGET GENE. LOC151124 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC151124, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151124 BINDING SITE, designated SEQ ID:13174, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25891] Another function of GAM169 is therefore inhibition of LOC151124 (Accession XM_098006.2) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151124.

[25892] LOC151723 (Accession XM_093395.6) is another GAM169 target gene, herein designated TARGET GENE. LOC151723 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC151723, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC151723 BINDING SITE, designated SEQ ID:11154, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25893] Another function of GAM169 is therefore inhibition of LOC151723 (Accession XM_093395.6) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151723.

[25894] LOC157931 (Accession XM_098845.1) is another GAM169 target gene, herein designated TARGET GENE. LOC157931 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC157931, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC157931 BINDING SITE, designated SEQ ID:8404, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25895] Another function of GAM169 is therefore inhibition of LOC157931 (Accession XM_098845.1) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC157931.

[25896] LOC197259 (Accession) is another GAM169 target gene, herein designated TARGET GENE. LOC197259 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC197259, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC197259 BINDING SITE, designated SEQ ID:18112, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25897] Another function of GAM169 is therefore inhibition of LOC197259 (Accession) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197259.

[25898] LOC220763 (Accession XM_055551.4) is another GAM169 target gene, herein designated TARGET GENE. LOC220763 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC220763, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC220763 BINDING SITE, designated SEQ ID:7258, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25899] Another function of GAM169 is therefore inhibition of LOC220763 (Accession XM_055551.4) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220763.

[25900] LOC222068 (Accession XM_166556.3) is another GAM169 target gene, herein designated TARGET GENE. LOC222068 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC222068, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC222068 BINDING SITE, designated SEQ ID:15325, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25901] Another function of GAM169 is therefore inhibition of LOC222068 (Accession XM_166556.3) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222068.

[25902] LOC257486 (Accession) is another GAM169 target gene, herein designated TARGET GENE. LOC257486 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC257486, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC257486 BINDING SITE, designated SEQ ID:10209, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25903] Another function of GAM169 is therefore inhibition of LOC257486 (Accession) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257486.

[25904] Leucine-rich repeat protein, neuronal 3 (LRRN3, Accession) is another GAM169 target gene, herein designated TARGET GENE. LRRN3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LRRN3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LRRN3 BINDING SITE, designated

SEQ ID:11257, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25905] Another function of GAM169 is therefore inhibition of Leucine-rich repeat protein, neuronal 3 (LRRN3, Accession) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRRN3.

[25906] MGC5466 (Accession NM_030922.1) is another GAM169 target gene, herein designated TARGET GENE. MGC5466 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC5466, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC5466 BINDING SITE, designated SEQ ID:9839, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25907] Another function of GAM169 is therefore inhibition of MGC5466 (Accession NM_030922.1) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5466.

[25908] MTCH1 (Accession NM_014341.1) is another GAM169 target gene, herein designated TARGET GENE. MTCH1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MTCH1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MTCH1 BINDING SITE, designated SEQ ID:5849, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25909] Another function of GAM169 is therefore inhibition of MTCH1 (Accession NM_014341.1) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTCH1.

[25910] Natriuretic peptide receptor a/guanylate cyclase a (atrionatriuretic peptide receptor a) (NPR1, Accession NM_000906.1) is another GAM169 target gene, herein designated TARGET GENE. NPR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NPR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of NPR1 BINDING SITE, designated SEQ ID:2666, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25911] Another function of GAM169 is therefore inhibition of Na-triuretic peptide receptor a/guanylate cyclase a (atrionatriuretic peptide receptor a) (NPR1, Accession NM_000906.1), a gene which has guanylate cyclase activity on binding of anf. Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPR1.

[25912] The function of NPR1 has been established by previous studies. The precursor of atrial natriuretic peptide (ANP; 108780) is produced and stored mainly in the right atrium of the heart (see OMIM Ref. No. Oliver et al., 1997). ANP formed from this precursor is released in response to atrial stretch. Once in the circulation, ANP binds to the natriuretic peptide receptor A (ANPRA, or NPR1), also known as guanylate cyclase A (or GC- A), mainly in the kidney, vascular tissue, and adrenal gland. This binding induces an increase in intracellular cGMP and initiates natriuresis, diuresis, and vasodilation, all of which contribute to lowering blood pressure. 'B- type' natriuretic peptide, a structurally related peptide formed mainly in the cardiac

ventricles, also acts through ANPRA and has effects similar to ANP. Lowe et al. (1990) assigned the ANPRA gene to 1q12- qter by PCR analysis of genomic DNA from somatic cell hybrids. By in situ hybridization, the gene was further localized to 1q21- q22.

[25913] Animal model experiments lend further support to the function of NPR1. To study the role of NPRA in the regulation of blood pressure and in the cardiovascular response to sustained hypertension, Oliver et al. (1997) made mice completely lacking this receptor. They found that mice lacking a functional Npr1 gene coding for NPRA had elevated blood pressures and heart exhibiting marked hypertrophy with interstitial fibrosis resembling that seen in human hypertensive heart disease. Echocardiographic evaluation of the mice demonstrated a compensated state of systemic hypertension in which cardiac hypertrophy and dilatation were evident but with no reduction in ventricular performance. Nevertheless, sudden death, with morphologic evidence indicative in some animals of congestive heart failure and in others of aortic dissection, occurred in all 15 male mice lacking Npr1 before 6 months of age, and in 1 of 16 females in this study.

[25914] It is appreciated that the abovementioned animal model

for NPR1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[25915] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25916] Lowe, D. G.; Klisak, I.; Sparkes, R. S.; Mohandas, T.; Goeddel, D. V. : Chromosomal distribution of three members of the human natriuretic peptide receptor/guanylyl cyclase gene family. Genomics 8: 304- 312, 1990. ; and

[25917] Oliver, P. M.; Fox, J. E.; Kim, R.; Rockman, H. A.; Kim, H.-S.; Reddick, R. L.; Pandey, K. N.; Milgram, S. L.; Smithies, O.; Maeda, N. : Hypertension, cardiac hypertrophy, and sudden dea.

[25918] Further studies establishing the function and utilities of NPR1 are found in John Hopkins OMIM database record ID 108960, and in cited publications listed in Table 5, which are hereby incorporated by reference.phorbolin-1 (Accession) is another GAM169 target gene, herein designated TARGET GENE. phorbolin-1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by phorbolin-1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of phorbolin-1 BINDING SITE, designated SEQ ID:1815, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25919] Another function of GAM169 is therefore inhibition of phorbolin-1 (Accession) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with phorbolin-1.

[25920] PP1665 (Accession NM_030792.2) is another GAM169 target gene, herein designated TARGET GENE. PP1665 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PP1665, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PP1665 BINDING SITE, designated SEQ ID:5088, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25921] Another function of GAM169 is therefore inhibition of PP1665 (Accession NM_030792.2) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with PP1665.

[25922] Peroxisome proliferative activated receptor, gamma, coactivator 1 (PPARGC1, Accession NM_013261.2) is another GAM169 target gene, herein designated TARGET GENE. PPARGC1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PPARGC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPARGC1 BINDING SITE, designated SEQ ID:16406, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25923] Another function of GAM169 is therefore inhibition of Peroxisome proliferative activated receptor, gamma, coactivator 1 (PPARGC1, Accession NM_013261.2), a gene which may play a role in insulin sensitivity and thermogenesis and therefore may be associated with Familial partial lipodystrophy and type ii diabetes. Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of Familial partial lipodystrophy and type ii diabetes, and of other diseases and clinical conditions associated with

PPARGC1.

[25924] The function of PPARGC1 has been established by previous studies. Adaptive thermogenesis is an important component of energy homeostasis and a metabolic defense against obesity, which is characterized by a chronic imbalance between energy intake and expenditure. Part of energy expenditure results from a leaking of protons across the mitochondrial inner membrane which leads to energy dissipation because of uncoupling of oxygen consumption to ATP synthesis. Three mitochondrial uncoupling proteins, UCP1 (OMIM Ref. No. 113730), UCP2 (OMIM Ref. No. 601693), and UCP3 (OMIM Ref. No. 602044), are candidates to explain the proton leak. The most compelling evidence for a direct role of uncoupling proteins in the proton leak comes from data on brown fat- specific UCP1. During cold exposure, energy dissipation is increased through brown adipose tissue (BAT) hypertrophy, biogenesis of mitochondria, and increased expression and activation of UCP1. Data pointed to peroxisome proliferator- activated receptor- gamma (PPARG; 601487) as a transcriptional regulator of uncoupling protein expression. PPAR- gamma is a nuclear receptor activated by fatty acids and eicosanoids which plays a major

role in adipocyte differentiation. In brown fat cells, PPARG activates an enhancer of the UCP1 gene promoter. Puigserver et al. (1998) cloned a novel transcription coactivator of nuclear receptors, termed Pgc1, from a mouse brown fat cDNA library. Pgc1 mRNA expression was dramatically elevated upon cold exposure of mice in both brown fat and skeletal muscle, key thermogenic tissues. Pgc1 greatly increased the transcriptional activity of Ppar-gamma (OMIM Ref. No. 601487) and thyroid hormone receptor (see OMIM Ref. No. 190120) on the uncoupling protein Ucp1 (OMIM Ref. No. 113730) promoter. Ectopic expression of Pgc1 in white adipose cells activated expression of Ucp1 and key mitochondrial enzymes of the respiratory chain, and increased the cellular content of mitochondrial DNA. Puigserver et al. (1998) suggested that PGC1 plays a key role in linking nuclear receptors to the transcriptional program of adaptive thermogenesis.

[25925] Animal model experiments lend further support to the function of PPARGC1. Herzig et al. (2001) demonstrated that mice carrying a targeted disruption of the cAMP response element- binding (CREB) protein gene (OMIM Ref. No. 123810), or overexpressing a dominant- negative CREB inhibitor, exhibit fasting hyperglycemia and reduced

expression of gluconeogenic enzymes. CREB was found to induce expression of the gluconeogenic program through the nuclear receptor coactivator PGC1, which was demonstrated to be a direct target for CREB regulation in vivo. Overexpression of PGC1 in CREB- deficient mice restored glucose homeostasis and rescued the expression of gluconeogenic genes. In transient assays, PGC1 potentiated glucocorticoid induction of the gene for PEPCK, the rate-limiting enzyme in gluconeogenesis. PGC1 promotes cooperativity between cAMP and glucocorticoid signaling pathways during hepatic gluconeogenesis. Fasting hyperglycemia is strongly correlated with type II diabetes (OMIM Ref. No. 125853), so Herzig et al. (2001) concluded that the activation of PGC1 by CREB in liver contributes importantly to the pathogenesis of this disease.

[25926] It is appreciated that the abovementioned animal model for PPARGC1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[25927] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25928] Puigserver, P.; Wu, Z.; Park, C. W.; Graves, R.; Wright, M.;

Spiegelman, B. M. : A cold- inducible coactivator of nuclear receptors linked to adaptive thermogenesis. Cell 92: 829- 839, 1998. ; and

[25929] Herzig, S.; Long, F.; Jhala, U. S.; Hedrick, S.; Quinn, R.; Bauer, A.; Rudolph, D.; Schutz, G.; Yoon, C.; Puigserver, P.; Spiegelman, B.; Montminy, M. : CREB regulates hepatic gluconeoge.

[25930] Further studies establishing the function and utilities of PPARGC1 are found in John Hopkins OMIM database record ID 604517, and in cited publications listed in Table 5, which are hereby incorporated by reference.Regulator of g-protein signalling 19 interacting protein 1 (RGS19IP1, Accession NM_005716.1) is another GAM169 target gene, herein designated TARGET GENE. RGS19IP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RGS19IP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RGS19IP1 BINDING SITE, designated SEQ ID:5745, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25931] Another function of GAM169 is therefore inhibition of

Regulator of g-protein signalling 19 interacting protein 1 (RGS19IP1, Accession NM_005716.1), a gene which is involved in g protein- linked signaling. Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS19IP1.

[25932] The function of RGS19IP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM129.1.RPF-1 (Accession NM_007252.1) is another GAM169 target gene, herein designated TARGET GENE. RPF-1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by RPF-1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RPF-1 BINDING SITE, designated SEQ ID:12622, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25933] Another function of GAM169 is therefore inhibition of RPF-1 (Accession NM_007252.1) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPF-1.

[25934] Src-like-adaptor (SLA, Accession NM_006748.1) is another GAM169 target gene, herein designated TARGET GENE. SLA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLA BINDING SITE, designated SEQ ID:4672, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25935] Another function of GAM169 is therefore inhibition of Src-like-adaptor (SLA, Accession NM_006748.1), a gene which is a negative regulator of T- cell receptor signaling. Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLA.

[25936] The function of SLA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Sparc/osteonectin, cwcv and kazal-like domains proteoglycan (testican) (SPOCK, Accession NM_004598.2) is another GAM169 target gene, herein designated TARGET GENE. SPOCK BINDING SITE is a target

binding site found in the 3` untranslated region of mRNA encoded by SPOCK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SPOCK BINDING SITE, designated SEQ ID:16266, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25937] Another function of GAM169 is therefore inhibition of Sparc/osteonectin, cwcv and kazal-like domains proteoglycan (testican) (SPOCK, Accession NM_004598.2) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPOCK.

[25938] Ubiquitin-conjugating enzyme e2l 3 (UBE2L3, Accession NM_003347.1) is another GAM169 target gene, herein designated TARGET GENE. UBE2L3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by UBE2L3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UBE2L3 BINDING SITE, designated SEQ ID:9338, to the nucleotide sequence of

GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25939] Another function of GAM169 is therefore inhibition of Ubiquitin-conjugating enzyme e2l 3 (UBE2L3, Accession NM_003347.1), a gene which catalyzes the covalent attachment of ubiquitin to other proteins. and therefore may be associated with Parkinson disease. Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of Parkinson disease, and of other diseases and clinical conditions associated with UBE2L3.

[25940] The function of UBE2L3 has been established by previous studies. Shimura et al. (2001) hypothesized that alpha-synuclein (OMIM Ref. No. 163890) and parkin (OMIM Ref. No. 602544) interact functionally, namely, that parkin ubiquitinates alpha- synuclein normally and that this process is altered in autosomal recessive Parkinson disease (OMIM Ref. No. 600116). Shimura et al. (2001) identified a protein complex in normal human brain that includes parkin as the E3 ubiquitin ligase, UBCH7 as its associated E2 ubiquitin- conjugating enzyme, and a novel 22- kD glycosylated form of alpha- synuclein (alpha- Sp22) as its substrate. In contrast to normal parkin, mutant parkin associated with autosomal recessive Parkinson disease failed

to bind alpha- Sp22. In an in vitro ubiquitination assay, alpha- Sp22 was modified by normal, but not mutant, parkin into polyubiquitinated, high molecular weight species. Accordingly, alpha- Sp22 accumulated in a nonubiquitinated form in parkin- deficient Parkinson disease brains. Shimura et al. (2001) concluded that alpha- Sp22 is a substrate for parkin's ubiquitin ligase activity in normal human brain and that loss of parkin function causes pathologic accumulation of alpha- Sp22. These findings demonstrated a critical biochemical reaction between the 2 Parkinson disease- linked gene products and suggested that this reaction underlies the accumulation of ubiquitinated alpha- synuclein in conventional Parkinson disease. By RT- PCR, Moynihan et al. (1998) determined that UBE2L3 is expressed as 4 mRNAs that differ in the length of the 3- prime untranslated region (UTR). Sequence comparisons revealed that the human and mouse UBE2L3 cDNAs share 97% DNA sequence identity in the coding region and 93% identity for 287 nucleotides extending into the 3- prime UTR. The predicted mouse and human UBE2L3 proteins are identical.

[25941]

[25942] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[25943] Moynihan, T. P.; Cole, C. G.; Dunham, I.; O'Neil, L.; Markham, A. F.; Robinson, P. A. : Fine- mapping, genomic organization, and transcript analysis of the human ubiquitin- conjugating enzyme gene UBE2L3. Genomics 51: 124- 127, 1998. ; and

[25944] Shimura, H.; Schlossmacher, M. G.; Hattori, N.; Frosch, M. P.; Trockenbacher, A.; Schneider, R.; Mizuno, Y.; Kosik, K. S.; Selkoe, D. J. : Ubiquitination of a new form of alpha-synuclei.

[25945] Further studies establishing the function and utilities of UBE2L3 are found in John Hopkins OMIM database record ID 603721, and in cited publications listed in Table 5, which are hereby incorporated by reference.Wd repeat domain 7 (WDR7, Accession NM_015285.1) is another GAM169 target gene, herein designated TARGET GENE. WDR7 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by WDR7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WDR7 BINDING SITE, designated

SEQ ID:18603, to the nucleotide sequence of GAM169 RNA, herein designated GAM RNA, also designated SEQ ID:365.

[25946] Another function of GAM169 is therefore inhibition of Wd repeat domain 7 (WDR7, Accession NM_015285.1) . Accordingly, utilities of GAM169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WDR7.

[25947]

[25948] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 170 (GAM170), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25949] GAM170 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM170 was detected is described hereinabove with reference to Figs. 8-15.

[25950] GAM170 gene, herein designated GAM GENE, and GAM170 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[25951] GAM170 gene encodes a GAM170 precursor RNA, herein

designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM170 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM170 precursor RNA is designated SEQ ID:72, and is provided hereinbelow with reference to the sequence listing part.

[25952] GAM170 precursor RNA folds onto itself, forming GAM170 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25953] GAM170 precursor RNA folds onto itself, forming GAM170 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate

or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[25954] Nucleotide sequence of GAM170 precursor RNA, designated SEQ-ID: 72, and a schematic representation of a predicted secondary folding of GAM170 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[25955] An enzyme complex designated DICER COMPLEX, `dices` the GAM170 folded precursor RNA into GAM170 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM170 RNA is designated SEQ ID:283, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[25956] GAM170 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM170 target RNA, herein designated GAM TARGET RNA. GAM170 target RNA comprises three regions, as is typical of mRNA of

a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25957] GAM170 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM170 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM170 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM170 RNA may have a different number of target binding sites in untranslated regions of a GAM170 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25958] The complementary binding of GAM170 RNA, herein des-

ignated GAM RNA, to target binding sites on GAM170 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM170 target RNA into GAM170 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25959] It is appreciated that GAM170 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM170 target genes. The mRNA of each one of this plurality of GAM170 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM170 RNA, herein designated GAM RNA, and which when bound by GAM170 RNA causes inhibition of translation of respective one or more GAM170 target proteins.

[25960] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM170 gene, herein designated GAM GENE, on one or more GAM170 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary bind-

ing site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25961] It is appreciated that specific functions and accordingly utilities of GAM170 correlate with, and may be deduced from, the identity of the target genes which GAM170 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25962]

[25963]

[25964] LOC121457 (Accession) is a GAM170 target gene, herein designated TARGET GENE. LOC121457 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC121457, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC121457

BINDING SITE, designated SEQ ID:4519, to the nucleotide sequence of GAM170 RNA, herein designated GAM RNA, also designated SEQ ID:283.

[25965] A function of GAM170 is therefore inhibition of LOC121457 (Accession) . Accordingly, utilities of GAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121457.

[25966] LOC145483 (Accession) is another GAM170 target gene, herein designated TARGET GENE. LOC145483 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC145483, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145483 BINDING SITE, designated SEQ ID:5675, to the nucleotide sequence of GAM170 RNA, herein designated GAM RNA, also designated SEQ ID:283.

[25967] Another function of GAM170 is therefore inhibition of LOC145483 (Accession) . Accordingly, utilities of GAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145483.

[25968] LOC150113 (Accession) is another GAM170 target gene, herein designated TARGET GENE. LOC150113 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC150113, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150113 BINDING SITE, designated SEQ ID:16990, to the nucleotide sequence of GAM170 RNA, herein designated GAM RNA, also designated SEQ ID:283.

[25969] Another function of GAM170 is therefore inhibition of LOC150113 (Accession) . Accordingly, utilities of GAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150113.

[25970] Pyrimidinergic receptor p2y, g-protein coupled, 6 (P2RY6, Accession NM_176796.1) is another GAM170 target gene, herein designated TARGET GENE. P2RY6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by P2RY6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

P2RY6 BINDING SITE, designated SEQ ID:2447, to the nucleotide sequence of GAM170 RNA, herein designated GAM RNA, also designated SEQ ID:283.

[25971] Another function of GAM170 is therefore inhibition of Pyrimidinergic receptor p2y, g-protein coupled, 6 (P2RY6, Accession NM_176796.1), a gene which mediates cellular responses to nucleotides. Accordingly, utilities of GAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RY6.

[25972] The function of P2RY6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM72.1.SRp25 (Accession) is another GAM170 target gene, herein designated TARGET GENE. SRp25 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SRp25, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SRp25 BINDING SITE, designated SEQ ID:1331, to the nucleotide sequence of GAM170 RNA, herein designated GAM RNA, also designated SEQ ID:283.

[25973] Another function of GAM170 is therefore inhibition of

SRp25 (Accession) . Accordingly, utilities of GAM170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRp25.

[25974]

[25975] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 171 (GAM171), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25976] GAM171 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM171 was detected is described hereinabove with reference to Figs. 8-15.

[25977] GAM171 gene, herein designated GAM GENE, and GAM171 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[25978] GAM171 gene encodes a GAM171 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM171 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM171 precursor RNA is designated SEQ ID:17, and is

provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:17 is located at position 242532302 relative to chromosome 2.

[25979] GAM171 precursor RNA folds onto itself, forming GAM171 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25980] GAM171 precursor RNA folds onto itself, forming GAM171 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[25981] Nucleotide sequence of GAM171 precursor RNA, designated SEQ-ID: 17, and a schematic representation of a

predicted secondary folding of GAM171 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[25982] An enzyme complex designated DICER COMPLEX, `dices` the GAM171 folded precursor RNA into GAM171 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM171 RNA is designated SEQ ID:392, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[25983] GAM171 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM171 target RNA, herein designated GAM TARGET RNA. GAM171 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25984] GAM171 RNA, herein designated GAM RNA, binds com-

plementarily to one or more target binding sites located in untranslated regions of GAM171 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM171 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM171 RNA may have a different number of target binding sites in untranslated regions of a GAM171 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25985] The complementary binding of GAM171 RNA, herein designated GAM RNA, to target binding sites on GAM171 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM171 target RNA into GAM171 tar-

get protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25986] It is appreciated that GAM171 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM171 target genes. The mRNA of each one of this plurality of GAM171 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM171 RNA, herein designated GAM RNA, and which when bound by GAM171 RNA causes inhibition of translation of respective one or more GAM171 target proteins.

[25987] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM171 gene, herein designated GAM GENE, on one or more GAM171 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other

genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25988] It is appreciated that specific functions and accordingly utilities of GAM171 correlate with, and may be deduced from, the identity of the target genes which GAM171 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25989]

[25990]

[25991] Dead/h (asp-glu-ala-asp/his) box polypeptide 6 (rna helicase, 54kda) (DDX6, Accession NM_004397.3) is a GAM171 target gene, herein designated TARGET GENE. DDX6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DDX6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DDX6 BINDING SITE, designated SEQ ID:12093, to the nucleotide sequence of GAM171 RNA, herein designated GAM RNA, also designated SEQ ID:392.

[25992] A function of GAM171 is therefore inhibition of Dead/h (asp-glu-ala-asp/his) box polypeptide 6 (rna helicase, 54kda) (DDX6, Accession NM_004397.3), a gene which is putative RNA helicases and therefore may be associated with Hematopoietic tumors . Accordingly, utilities of GAM171 include diagnosis, prevention and treatment of Hematopoietic tumors ., and of other diseases and clinical conditions associated with DDX6.

[25993] The function of DDX6 has been established by previous studies. DEAD box proteins are putative RNA helicases that have a characteristic Asp- Glu- Ala- Asp (DEAD) box as 1 of 8 highly conserved sequence motifs. Akao et al. (1991) cloned the breakpoint of the t(11;14)(q23;q32) in B- cell lymphoma, as represented in the RC- K8 cell line, and named the locus RCK. By pulsed field gel elec- trophoresis, RCK was shown to be centromeric to the gene for porphobilinogen deaminase (OMIM Ref. No. 176000), while the breakpoints of t(11;19)(q23;p13) were detected by the CD3D gene probe (OMIM Ref. No. 186790), which is centromeric to RCK. Akao et al. (1992) did long- range mapping from the CD3 genes to the PBGD gene on 11q23 to determine the relationship between RCK and MLL- ALL1 (OMIM Ref. No. 159555). They showed that RCK and MLL

are on different NotI fragments, indicating that 2 different genes are associated with 11q23 translocations in hematopoietic tumors. Seto et al. (1995) found that the RCK/P54 gene, which had been found to encode a 472 to 483 amino acid- peptide belonging to the RNA helicase/ translation initiation factor family, is highly conserved in the mouse. The mouse cDNA showed 93.7% nucleotide identity and 97.7% predicted amino acid identity with human RCK. Lu and Yunis (1992) cloned a putative human RNA helicase, p54, from a lymphoid cell line with chromosomal breakpoint 11q23.3. The predicted amino acid sequence shared 75% identity with the female germline-specific RNA helicase ME31B gene of Drosophila. Unlike ME31B, however, the new gene expressed an abundant transcript in a large number of adult tissues and its 5-prime noncoding region was found to be split in a t(11;14)(q23.3;q32.3) cell line from a diffuse large B- cell lymphoma. Tunnacliffe et al. (1993) assigned the HLR2 gene more precisely using a panel of sequence tagged sites (STSs) representing 30 markers previously assigned to 11q23. Using fluorescence in situ hybridization, Akao and Matsuda (1996) mapped the Ddx6 gene to mouse chromosome 9.

[25994]

[25995] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25996] Akao, Y.; Seto, M.; Yamamoto, K.; Iida, S.; Nakazawa, S.; Inazawa, J.; Abe, T.; Takahashi, T.; Ueda, R. : The RCK gene associated with t(11;14) translocation is distinct from the MLL/ALL- 1 gene with t(4;11) and t(11;19) translocations. Cancer Res. 52: 6083- 6087, 1992. ; and

[25997] Akao, Y.; Tsujimoto, Y.; Finan, J.; Nowell, P. C.; Croce, C. M. : Molecular characterization of a t(11;14)(q23;q32) chromosome translocation in a B- cell lymphoma. Cancer Res. 50: 4856- 4.

[25998] Further studies establishing the function and utilities of DDX6 are found in John Hopkins OMIM database record ID 600326, and in cited publications listed in Table 5, which are hereby incorporated by reference.Glucokinase (hexokinase 4) regulatory protein (GCKR, Accession NM_001486.1) is another GAM171 target gene, herein designated TARGET GENE. GCKR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GCKR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GCKR BINDING SITE, designated SEQ ID:12938, to the nucleotide sequence of GAM171 RNA, herein designated GAM RNA, also designated SEQ ID:392.

[25999] Another function of GAM171 is therefore inhibition of Glucokinase (hexokinase 4) regulatory protein (GCKR, Accession NM_001486.1), a gene which inhibits glucokinase by forming an inactive complex with this enzyme. and therefore may be associated with Maturity- onset diabetes of the young (mody) type ii. Accordingly, utilities of GAM171 include diagnosis, prevention and treatment of Maturity- onset diabetes of the young (mody) type ii., and of other diseases and clinical conditions associated with GCKR.

[26000] The function of GCKR has been established by previous studies. Glucokinase (GCK; 138079) in the liver and pancreatic beta cells is subject to inhibition by a regulatory protein, GCKR. The inhibitory effect of GCKR depends on the presence of fructose- 6- phosphate and is antagonized by fructose- 1- phosphate. Warner et al. (1995) noted that mutations in GCKR might be diabetogenic if they resulted in the synthesis of proteins with increased

inhibitory activity, perhaps reflecting increased sensitivity to fructose- 6- phosphate or reduced susceptibility to antagonism by fructose- 1- phosphate. Warner et al. (1995) determined the complete sequence of human GCKR cDNA, isolated YAC clones containing human GCKR, and localized them to 2p23 by fluorescence in situ hybridization. The GCKR cDNA encodes a protein of 625 amino acids. Vaxillaire et al. (1994) had previously assigned the GCKR gene to 2p23- p22.3. Given the role of glucokinase in the causation of maturity- onset diabetes of the young (MODY) type II (OMIM Ref. No. 125851), GCKR had been considered a candidate gene for a form of MODY. To further understand the role of glucokinase regulatory protein, which they symbolized GKRP, Farrelly et al. (1999) inactivated the mouse homolog. With the knockout of the mouse gene, there was a parallel loss of glucokinase protein and activity in mutant mouse liver. The loss was primarily because of posttranscriptional regulation of glucokinase, indicating a positive regulatory role for GKRP in maintaining glucokinase levels and activity. As in rat hepatocytes, both glucokinase and GKRP were localized in the nuclei of mouse hepatocytes cultured in low glucose-containing medium. In the presence of fructose or high

concentrations of glucose, conditions known to relieve glucokinase inhibition by GKRP in vitro, only glucokinase was translocated into the cytoplasm. In the GKRP- mutant hepatocytes, glucokinase was not found in the nucleus under any tested conditions. Farrelly et al. (1999) proposed that GKRP functions as an anchor to sequester and inhibit glucokinase in the hepatocyte nucleus, where it is protected from degradation. This ensures that glucose phosphorylation is minimal when the liver is in the fasting, glucose- producing phase. This also enables the hepatocytes rapidly to mobilize glucokinase into the cytoplasm to phosphorylate and store or metabolize glucose after the ingestion of dietary glucose. In GKRP- mutant mice, the disruption of this regulation and the subsequent decrease in GK activity led to altered glucose metabolism and impaired glycemic control.

[26001]

[26002] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26003] Farrelly, D.; Brown, K. S.; Tieman, A.; Ren, J.; Lira, S. A.; Hagan, D.; Gregg, R.; Mookhtiar, K. A.; Hariharan, N. : Mice mutant for glucokinase regulatory protein exhibit

decreased liver glucokinase: a sequestration mechanism in metabolic regulation. Proc. Nat. Acad. Sci. 96: 14511-14516, 1999. ; and

[26004] Vaxillaire, M.; Vionnet, N.; Vigouroux, C.; Sun, F.; Espinosa, R., III; LeBeau, M. M.; Stoffel, M.; Lehto, M.; Beckmann, J. S.; Detheux, M.; Passa, P.; Cohen, D.; Van Schaftingen, E.; V.

[26005] Further studies establishing the function and utilities of GCKR are found in John Hopkins OMIM database record ID 600842, and in cited publications listed in Table 5, which are hereby incorporated by reference.KIAA0042 (Accession) is another GAM171 target gene, herein designated TARGET GENE. KIAA0042 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0042, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0042 BINDING SITE, designated SEQ ID:5935, to the nucleotide sequence of GAM171 RNA, herein designated GAM RNA, also designated SEQ ID:392.

[26006] Another function of GAM171 is therefore inhibition of KIAA0042 (Accession) . Accordingly, utilities of GAM171

include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0042.

[26007] KIAA1030 (Accession XM_290502.1) is another GAM171 target gene, herein designated TARGET GENE. KIAA1030 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1030, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1030 BINDING SITE, designated SEQ ID:8929, to the nucleotide sequence of GAM171 RNA, herein designated GAM RNA, also designated SEQ ID:392.

[26008] Another function of GAM171 is therefore inhibition of KIAA1030 (Accession XM_290502.1) . Accordingly, utilities of GAM171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1030.

[26009] KIAA1036 (Accession NM_014909.1) is another GAM171 target gene, herein designated TARGET GENE. KIAA1036 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1036, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of KIAA1036 BINDING SITE, designated SEQ ID:13086, to the nucleotide sequence of GAM171 RNA, herein designated GAM RNA, also designated SEQ ID:392.

[26010] Another function of GAM171 is therefore inhibition of KIAA1036 (Accession NM_014909.1) . Accordingly, utilities of GAM171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1036.

[26011] LOC148113 (Accession) is another GAM171 target gene, herein designated TARGET GENE. LOC148113 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC148113, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148113 BINDING SITE, designated SEQ ID:8770, to the nucleotide sequence of GAM171 RNA, herein designated GAM RNA, also designated SEQ ID:392.

[26012] Another function of GAM171 is therefore inhibition of LOC148113 (Accession) . Accordingly, utilities of GAM171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC148113.

[26013]

[26014] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 172 (GAM172), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26015] GAM172 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM172 was detected is described hereinabove with reference to Figs. 8-15.

[26016] GAM172 gene, herein designated GAM GENE, and GAM172 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[26017] GAM172 gene encodes a GAM172 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM172 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM172 precursor RNA is designated SEQ ID:86, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:86 is located at po-

sition 195192414 relative to chromosome 1.

[26018] GAM172 precursor RNA folds onto itself, forming GAM172 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26019] GAM172 precursor RNA folds onto itself, forming GAM172 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[26020] Nucleotide sequence of GAM172 precursor RNA, designated SEQ-ID: 86, and a schematic representation of a predicted secondary folding of GAM172 folded precursor RNA are further described with reference to Table 2,

hereby incorporated by reference.

[26021] An enzyme complex designated DICER COMPLEX, `dices` the GAM172 folded precursor RNA into GAM172 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM172 RNA is designated SEQ ID:253, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[26022] GAM172 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM172 target RNA, herein designated GAM TARGET RNA. GAM172 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[26023] GAM172 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM172 target RNA, herein des-

ignated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM172 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM172 RNA may have a different number of target binding sites in untranslated regions of a GAM172 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26024] The complementary binding of GAM172 RNA, herein designated GAM RNA, to target binding sites on GAM172 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM172 target RNA into GAM172 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26025] It is appreciated that GAM172 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM172 target genes. The mRNA of each one of this plurality of GAM172 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM172 RNA, herein designated GAM RNA, and which when bound by GAM172 RNA causes inhibition of translation of respective one or more GAM172 target proteins.

[26026] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM172 gene, herein designated GAM GENE, on one or more GAM172 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have

not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26027] It is appreciated that specific functions and accordingly utilities of GAM172 correlate with, and may be deduced from, the identity of the target genes which GAM172 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26028]

[26029]

[26030] Deiodinase, iodothyronine, type ii (DIO2, Accession NM_000793.2) is a GAM172 target gene, herein designated TARGET GENE. DIO2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DIO2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DIO2 BINDING SITE, designated SEQ ID:4073, to the nucleotide sequence of GAM172 RNA, herein designated GAM RNA, also designated SEQ ID:253.

[26031] A function of GAM172 is therefore inhibition of Deiodinase, iodothyronine, type ii (DIO2, Accession

NM_000793.2) . Accordingly, utilities of GAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIO2.

[26032] Protein tyrosine phosphatase, receptor type, c (PTPRC, Accession NM_002838.2) is another GAM172 target gene, herein designated TARGET GENE. PTPRC BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PTPRC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTPRC BINDING SITE, designated SEQ ID:11527, to the nucleotide sequence of GAM172 RNA, herein designated GAM RNA, also designated SEQ ID:253.

[26033] Another function of GAM172 is therefore inhibition of Protein tyrosine phosphatase, receptor type, c (PTPRC, Accession NM_002838.2) . Accordingly, utilities of GAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRC.

[26034] Transcription factor-like 5 (basic helix-loop-helix) (TCFL5, Accession NM_006602.1) is another GAM172 target gene, herein designated TARGET GENE. TCFL5 BINDING SITE is a target binding site found in the 3` untrans-

lated region of mRNA encoded by TCFL5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TCFL5 BINDING SITE, designated SEQ ID:11818, to the nucleotide sequence of GAM172 RNA, herein designated GAM RNA, also designated SEQ ID:253.

[26035] Another function of GAM172 is therefore inhibition of Transcription factor-like 5 (basic helix-loop-helix) (TCFL5, Accession NM_006602.1) . Accordingly, utilities of GAM172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCFL5.

[26036]

[26037] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 173 (GAM173), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26038] GAM173 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM173 was detected is described hereinabove with reference to Figs. 8-15.

[26039] GAM173 gene, herein designated GAM GENE, and GAM173 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[26040] GAM173 gene encodes a GAM173 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM173 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM173 precursor RNA is designated SEQ ID:124, and is provided hereinbelow with reference to the sequence listing part.

[26041] GAM173 precursor RNA folds onto itself, forming GAM173 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26042] GAM173 precursor RNA folds onto itself, forming GAM173 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[26043] Nucleotide sequence of GAM173 precursor RNA, designated SEQ-ID: 124, and a schematic representation of a predicted secondary folding of GAM173 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[26044] An enzyme complex designated DICER COMPLEX, `dices` the GAM173 folded precursor RNA into GAM173 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM173 RNA is designated SEQ ID:208, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[26045] GAM173 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM173 target RNA, herein designated GAM TARGET RNA. GAM173 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[26046] GAM173 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM173 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM173 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM173 RNA may have a different number of target binding sites in untranslated regions of a GAM173 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an

example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26047] The complementary binding of GAM173 RNA, herein designated GAM RNA, to target binding sites on GAM173 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM173 target RNA into GAM173 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26048] It is appreciated that GAM173 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM173 target genes. The mRNA of each one of this plurality of GAM173 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM173 RNA, herein designated GAM RNA, and which when bound by GAM173 RNA causes inhibition of translation of respective one or more GAM173 target proteins.

[26049] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM173 gene, herein designated GAM GENE, on one or

more GAM173 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26050] It is appreciated that specific functions and accordingly utilities of GAM173 correlate with, and may be deduced from, the identity of the target genes which GAM173 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26051]

[26052]

[26053] LOC149157 (Accession XM_086442.1) is a GAM173 target gene, herein designated TARGET GENE. LOC149157 BINDING SITE is a target binding site found in the 3` untrans-

lated region of mRNA encoded by LOC149157, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149157 BINDING SITE, designated SEQ ID:18849, to the nucleotide sequence of GAM173 RNA, herein designated GAM RNA, also designated SEQ ID:208.

[26054] A function of GAM173 is therefore inhibition of LOC149157 (Accession XM_086442.1) . Accordingly, utilities of GAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149157.

[26055] Spondin 1, (f-spondin) extracellular matrix protein (SPON1, Accession NM_006108.1) is another GAM173 target gene, herein designated TARGET GENE. SPON1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SPON1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SPON1 BINDING SITE, designated SEQ ID:15969, to the nucleotide sequence of GAM173 RNA, herein designated GAM RNA, also designated SEQ ID:208.

[26056] Another function of GAM173 is therefore inhibition of Spondin 1, (f-spondin) extracellular matrix protein (SPON1, Accession NM_006108.1) . Accordingly, utilities of GAM173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPON1.

[26057]

[26058] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 174 (GAM174), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26059] GAM174 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM174 was detected is described hereinabove with reference to Figs. 8-15.

[26060] GAM174 gene, herein designated GAM GENE, and GAM174 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[26061] GAM174 gene encodes a GAM174 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM174 precursor RNA does not encode a protein. A nucleotide sequence

identical or highly similar to the nucleotide sequence of GAM174 precursor RNA is designated SEQ ID:16, and is provided hereinbelow with reference to the sequence listing part.

[26062] GAM174 precursor RNA folds onto itself, forming GAM174 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26063] GAM174 precursor RNA folds onto itself, forming GAM174 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[26064] Nucleotide sequence of GAM174 precursor RNA, desig-

nated SEQ-ID: 16, and a schematic representation of a predicted secondary folding of GAM174 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[26065] An enzyme complex designated DICER COMPLEX, `dices` the GAM174 folded precursor RNA into GAM174 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM174 RNA is designated SEQ ID:252, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[26066] GAM174 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM174 target RNA, herein designated GAM TARGET RNA. GAM174 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[26067] GAM174 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM174 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM174 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM174 RNA may have a different number of target binding sites in untranslated regions of a GAM174 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26068] The complementary binding of GAM174 RNA, herein designated GAM RNA, to target binding sites on GAM174 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, in-

hibits translation of GAM174 target RNA into GAM174 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26069] It is appreciated that GAM174 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM174 target genes. The mRNA of each one of this plurality of GAM174 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM174 RNA, herein designated GAM RNA, and which when bound by GAM174 RNA causes inhibition of translation of respective one or more GAM174 target proteins.

[26070] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM174 gene, herein designated GAM GENE, on one or more GAM174 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by

those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26071] It is appreciated that specific functions and accordingly utilities of GAM174 correlate with, and may be deduced from, the identity of the target genes which GAM174 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26072]

[26073]

[26074] A kinase (prka) anchor protein 13 (AKAP13, Accession NM_007200.2) is a GAM174 target gene, herein designated TARGET GENE. AKAP13 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AKAP13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AKAP13 BINDING SITE, designated SEQ ID:2878, to the nucleotide sequence of GAM174 RNA, herein designated

GAM RNA, also designated SEQ ID:252.

[26075] A function of GAM174 is therefore inhibition of A kinase (prka) anchor protein 13 (AKAP13, Accession NM_007200.2), a gene which regulates subcellular localization of type II cAMP- dependent PKA. Accordingly, utilities of GAM174 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP13.

[26076] The function of AKAP13 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM54.1.D21S2056E (Accession NM_003683.2) is another GAM174 target gene, herein designated TARGET GENE. D21S2056E BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by D21S2056E, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of D21S2056E BINDING SITE, designated SEQ ID:3842, to the nucleotide sequence of GAM174 RNA, herein designated GAM RNA, also designated SEQ ID:252.

[26077] Another function of GAM174 is therefore inhibition of

D21S2056E (Accession NM_003683.2) . Accordingly, utilities of GAM174 include diagnosis, prevention and treatment of diseases and clinical conditions associated with D21S2056E.

[26078] DKFZP434O047 (Accession NM_015594.1) is another GAM174 target gene, herein designated TARGET GENE. DKFZP434O047 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZP434O047, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434O047 BINDING SITE, designated SEQ ID:7607, to the nucleotide sequence of GAM174 RNA, herein designated GAM RNA, also designated SEQ ID:252.

[26079] Another function of GAM174 is therefore inhibition of DKFZP434O047 (Accession NM_015594.1) . Accordingly, utilities of GAM174 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434O047.

[26080] Inhibin, beta b (activin ab beta polypeptide) (INHBB, Accession NM_002193.1) is another GAM174 target gene, herein designated TARGET GENE. INHBB BINDING SITE is a

target binding site found in the 5` untranslated region of mRNA encoded by INHBB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of INHBB BINDING SITE, designated SEQ ID:4697, to the nucleotide sequence of GAM174 RNA, herein designated GAM RNA, also designated SEQ ID:252.

[26081] Another function of GAM174 is therefore inhibition of Inhibin, beta b (activin ab beta polypeptide) (INHBB, Accession NM_002193.1), a gene which inhibins inhibit the secretion of follitropin by the pituitary gland. and therefore may be associated with Tumors. Accordingly, utilities of GAM174 include diagnosis, prevention and treatment of Tumors, and of other diseases and clinical conditions associated with INHBB.

[26082] The function of INHBB has been established by previous studies. The activins, dimers of beta- A or beta- B subunits encoded by the genes Inhba (OMIM Ref. No. 147290) and Inhbb, respectively, are TGF- beta (see OMIM Ref. No. 190180) superfamily members that have roles in reproduction and development (Brown et al., 2000). Activin ligands act as growth and differentiation factors in many

cells and tissues. Mellor et al. (2000) examined the localization of and dimerization among activin subunits. The results demonstrated that activin beta- C (see OMIM Ref. No. 601233) can form dimers with activin beta- A and beta- B in vitro, but not with the inhibin alpha subunit (OMIM Ref. No. 147380). Using a specific antibody, activin beta- C protein was localized to human liver and prostate and colocalized with beta- A and beta- B subunits to specific cell types in benign and malignant prostate tissues. The capacity to form novel activin heterodimers (but not inhibin C) appears to reside in the human liver and prostate. The authors concluded that formation of activin AC or BC heterodimers may have significant implications in the regulation of levels and/or biologic activity of other activins in these tissues. Malignancy of pheochromocytomas is difficult to estimate on the basis of histopathologic features. In a search for new markers to differentiate malignant pheochromocytomas from benign ones, Salmenkivi et al. (2001) tested the value of inhibin/activin subunit expression. Inhibins are heterodimeric glycoproteins consisting of an alpha subunit and either a beta- A or a beta- B subunit. Activins are composed of beta subunits only. Immunohistochemically, inhibin/activin beta- B

subunit was strongly positive in the normal adrenal medulla, but the cortex was negative. A striking difference was found in inhibin/activin beta- B expression between benign and malignant pheochromocytomas. The majority of benign adrenal tumors (27 of 30) showed strong or moderate immunoreactivity, whereas all 7 malignant tumors were negative or only weakly positive for inhibin/activin beta- B subunit. Salmenkivi et al. (2001) suggested that inhibin/activin beta- B subunit is expressed in normal adrenal medullary cells. Strong staining was found in most benign adrenal pheochromocytomas, whereas malignant tumors were almost negative. They concluded that loss of inhibin/activin beta- B subunit expression in pheochromocytomas may be used as an indicator of malignant potential.

[26083] Animal model experiments lend further support to the function of INHBB. Whereas mice homozygous for the Inhba- null allele demonstrate disruption of whisker, palate, and tooth development leading to neonatal lethality, homozygous Inhbb- null mice are viable, fertile, and have eye defects. To determine if these phenotypes were due to spatiotemporal expression differences of the ligands or disruption of specific ligand- receptor interactions, Brown

et al. (2000) replaced the region of Inhba encoding the mature protein with Inhbb, creating the allele designated Inhba(BK). Although the craniofacial phenotypes of the Inhba- null mutation were rescued by the Inhba(BK) allele, somatic, testicular, genital, and hair growth were grossly affected and influenced by the dosage and bioactivity of the allele. Thus, Brown et al. (2000) concluded that functional compensation within the TGF- beta superfamily can occur if the replacement gene is expressed appropriately. The novel phenotypes in these mice further illustrate the usefulness of insertion strategies for defining protein function. The structural organization of the testes of adult Inhba(BK/BK) mice was normal; however, the differentiation of the seminiferous tubules of Inhba(BK/-) mice was delayed. The testicular volumes of both Inhba(BK/BK) and Inhba(BK/-) mice were less than those of controls, and the dosage of the Inhba(BK) allele correlated positively with testicular size. Inhba(+/BK) males had normal onset of fertility, whereas Inhba(BK/BK) males had delayed onset of fertility similar to Acvr2 (OMIM Ref. No. 102581) - /- mice. Only 1 in 6 Inhba(BK/BK) females produced litters, whereas Inhba(+/BK) females were normally fertile. The ovaries of Inhba(BK/-) mice were smaller and contained

fewer large preantral follicles than those of controls. Inhba(BK/BK) and Inhba(BK/-) mice were identified by their smaller size, slower hair growth, the rough appearance of their fur, and sunken eyes. Approximately 50% of Inhba(BK/BK) mice died by 26 weeks, whereas Inhba(BK/-) mice invariably became cachectic and died between 3 and 4 weeks. The summary of phenotypic findings of Inhba(BK/-) mice includes short whiskers, normal tooth development, no cleft palate, symmetric growth deficiency (OMIM Ref. No. severe), enlargement of external genitalia, hypogonadism (OMIM Ref. No. severe), delayed hair growth (moderate), hypoglycemia (mild), decreased life expectancy (OMIM Ref. No. severe), and anemia

[26084] It is appreciated that the abovementioned animal model for INHBB is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[26085] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26086] Salmenkivi, K.; Arola, J.; Voutilainen, R.; Ilvesmaki, V.; Haglund, C.; Kahri, A. I.; Heikkila, P.; Liu, J. : Inhibin/activin beta- B- subunit expression in pheochromocytomas

favors benign diagnosis. J. Clin. Endocr. Metab. 86: 2231-2235, 2001. ; and

[26087] Brown, C. W.; Houston- Hawkins, D. E.; Woodruff, T. K.; Matzuk, M. M. : Insertion of Inhbb into the Inhba locus rescues the Inhba- null phenotype and reveals new activin functions. Nature.

[26088] Further studies establishing the function and utilities of INHBB are found in John Hopkins OMIM database record ID 147390, and in cited publications listed in Table 5, which are hereby incorporated by reference.LOC147165 (Accession XM_294884.1) is another GAM174 target gene, herein designated TARGET GENE. LOC147165 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC147165, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147165 BINDING SITE, designated SEQ ID:15184, to the nucleotide sequence of GAM174 RNA, herein designated GAM RNA, also designated SEQ ID:252.

[26089] Another function of GAM174 is therefore inhibition of LOC147165 (Accession XM_294884.1) . Accordingly, utilities of GAM174 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC147165.

[26090] LOC162417 (Accession) is another GAM174 target gene, herein designated TARGET GENE. LOC162417 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC162417, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC162417 BINDING SITE, designated SEQ ID:13555, to the nucleotide sequence of GAM174 RNA, herein designated GAM RNA, also designated SEQ ID:252.

[26091] Another function of GAM174 is therefore inhibition of LOC162417 (Accession) . Accordingly, utilities of GAM174 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162417.

[26092] MGC12921 (Accession NM_032728.1) is another GAM174 target gene, herein designated TARGET GENE. MGC12921 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC12921, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of MGC12921 BINDING SITE, designated SEQ ID:2736, to the nucleotide sequence of GAM174 RNA, herein designated GAM RNA, also designated SEQ ID:252.

[26093] Another function of GAM174 is therefore inhibition of MGC12921 (Accession NM_032728.1) . Accordingly, utilities of GAM174 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12921.

[26094] MGC15504 (Accession NM_032751.1) is another GAM174 target gene, herein designated TARGET GENE. MGC15504 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC15504, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC15504 BINDING SITE, designated SEQ ID:8930, to the nucleotide sequence of GAM174 RNA, herein designated GAM RNA, also designated SEQ ID:252.

[26095] Another function of GAM174 is therefore inhibition of MGC15504 (Accession NM_032751.1) . Accordingly, utilities of GAM174 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC15504.

[26096] Protein kinase, lysine deficient 2 (PRKWNK2, Accession) is another GAM174 target gene, herein designated TARGET GENE. PRKWNK2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PRKWNK2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRKWNK2 BINDING SITE, designated SEQ ID:20003, to the nucleotide sequence of GAM174 RNA, herein designated GAM RNA, also designated SEQ ID:252.

[26097] Another function of GAM174 is therefore inhibition of Protein kinase, lysine deficient 2 (PRKWNK2, Accession) . Accordingly, utilities of GAM174 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKWNK2.

[26098] Tumor protein d52-like 2 (TPD52L2, Accession NM_003288.1) is another GAM174 target gene, herein designated TARGET GENE. TPD52L2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TPD52L2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TPD52L2 BINDING SITE, designated SEQ ID:18571, to the nucleotide sequence of GAM174 RNA, herein designated GAM RNA, also designated SEQ ID:252.

[26099] Another function of GAM174 is therefore inhibition of Tumor protein d52-like 2 (TPD52L2, Accession NM_003288.1) . Accordingly, utilities of GAM174 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TPD52L2.

[26100] Ubiquitin specific protease 20 (USP20, Accession NM_006676.1) is another GAM174 target gene, herein designated TARGET GENE. USP20 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by USP20, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of USP20 BINDING SITE, designated SEQ ID:554, to the nucleotide sequence of GAM174 RNA, herein designated GAM RNA, also designated SEQ ID:252.

[26101] Another function of GAM174 is therefore inhibition of Ubiquitin specific protease 20 (USP20, Accession NM_006676.1) . Accordingly, utilities of GAM174 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with USP20.

[26102]

[26103] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 175 (GAM175), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26104] GAM175 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM175 was detected is described hereinabove with reference to Figs. 8-15.

[26105] GAM175 gene, herein designated GAM GENE, and GAM175 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[26106] GAM175 gene encodes a GAM175 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM175 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM175 precursor RNA is designated SEQ ID:28, and is provided hereinbelow with reference to the sequence list-

ing part. Nucleotide sequence SEQ ID:28 is located at position 557 relative to chromosome X.

[26107] GAM175 precursor RNA folds onto itself, forming GAM175 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26108] GAM175 precursor RNA folds onto itself, forming GAM175 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[26109] Nucleotide sequence of GAM175 precursor RNA, designated SEQ-ID: 28, and a schematic representation of a predicted secondary folding of GAM175 folded precursor

RNA are further described with reference to Table 2, hereby incorporated by reference.

[26110] An enzyme complex designated DICER COMPLEX, `dices` the GAM175 folded precursor RNA into GAM175 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: B) nucleotide sequence of GAM175 RNA is designated SEQ ID:265, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[26111] GAM175 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM175 target RNA, herein designated GAM TARGET RNA. GAM175 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[26112] GAM175 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in

untranslated regions of GAM175 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM175 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM175 RNA may have a different number of target binding sites in untranslated regions of a GAM175 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26113] The complementary binding of GAM175 RNA, herein designated GAM RNA, to target binding sites on GAM175 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM175 target RNA into GAM175 target protein, herein designated GAM TARGET PROTEIN.

GAM target protein is therefore outlined by a broken line.

[26114] It is appreciated that GAM175 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM175 target genes. The mRNA of each one of this plurality of GAM175 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM175 RNA, herein designated GAM RNA, and which when bound by GAM175 RNA causes inhibition of translation of respective one or more GAM175 target proteins.

[26115] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM175 gene, herein designated GAM GENE, on one or more GAM175 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific com-

plementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26116] It is appreciated that specific functions and accordingly utilities of GAM175 correlate with, and may be deduced from, the identity of the target genes which GAM175 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26117]

[26118]

[26119] Aminoadipate-semialdehyde dehydrogenase-phosphopantetheinyl transferase (AASDHPPT, Accession NP_056238.2) is a GAM175 target gene, herein designated TARGET GENE. AASDHPPT BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AASDHPPT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AASDHPPT BINDING SITE, designated SEQ ID:16747, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26120] A function of GAM175 is therefore inhibition of Aminoadipate-semialdehyde dehydrogenase-phosphopantetheinyl transferase (AASDHPPT, Accession NP_056238.2) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AASDHPPT.

[26121] Adenosine deaminase, rna-specific (ADAR, Accession NP_056655.1) is another GAM175 target gene, herein designated TARGET GENE. ADAR BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADAR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADAR BINDING SITE, designated SEQ ID:13257, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26122] Another function of GAM175 is therefore inhibition of Adenosine deaminase, rna-specific (ADAR, Accession NP_056655.1), a gene which converts adenosine to inosine in double- stranded RNA. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAR.

[26123] The function of ADAR has been established by previous studies. Double- stranded RNA- specific adenosine deaminase (DSRAD) was identified as a developmentally regulated dsRNA unwinding activity in early antisense experiments with Xenopus oocytes (Bass and Weintraub, 1988). The enzyme converts adenosine to inosine in dsRNA, which destabilizes the dsRNA helix. The RNA modifying activity of DSRAD is important for various functions. Among these are site- specific RNA editing of transcripts of the glutamate receptors (see OMIM Ref. No. 138248), which are channels for the neurotransmitter L- glutamate in the brain. DSRAD also functions to modify viral RNA genomes and may be responsible for hypermutation of certain negative- stranded viruses, such as measles, which may result in lethal measles inclusion body encephalitis (Weier et al., 1995). By fluorescence in situ hybridization, Weier et al. (1995) mapped the DSRAD gene to 1q21.1- q21.2, centromeric to the marker D1S1705. Wang et al. (1995) mapped the DRADA gene to 1q21 by fluorescence in situ hybridization. By FISH, Weier et al. (2000) mapped the mouse homolog (Adar) to chromosome 3F2.

[26124] Animal model experiments lend further support to the

function of ADAR. Wang et al. (2000) knocked out the Adar1 gene in mice by targeted disruption and found that heterozygosity for the Adar1 knockout causes embryonic lethality.

[26125] It is appreciated that the abovementioned animal model for ADAR is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[26126] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26127] Weier, H.- U. G.; George, C. X.; Greulich, K. M.; Samuel, C. E. : The interferon- inducible, double- stranded RNA- specific adenosine deaminase gene (DSRAD) maps to human chromosome 1q21.1- 21.2. Genomics 30: 372- 375, 1995. ; and

[26128] Wang, Q.; Khillan, J.; Gadue, P.; Nishikura, K. : Requirement of the RNA editing deaminase ADAR1 gene for embryonic erythropoiesis. Science 290: 1765- 1768, 2000.

[26129] Further studies establishing the function and utilities of ADAR are found in John Hopkins OMIM database record ID 601059, and in cited publications listed in Table 5, which are hereby incorporated by reference.Adenosine deami-

nase, rna-specific (ADAR, Accession NP_001102.1) is another GAM175 target gene, herein designated TARGET GENE. ADAR BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADAR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADAR BINDING SITE, designated SEQ ID:13257, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26130] Another function of GAM175 is therefore inhibition of Adenosine deaminase, rna-specific (ADAR, Accession NP_001102.1), a gene which converts adenosine to inosine in double- stranded RNA. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAR.

[26131] The function of ADAR has been established by previous studies. Double- stranded RNA- specific adenosine deaminase (DSRAD) was identified as a developmentally regulated dsRNA unwinding activity in early antisense experiments with Xenopus oocytes (Bass and Weintraub, 1988). The enzyme converts adenosine to inosine in dsRNA,

which destabilizes the dsRNA helix. The RNA modifying activity of DSRAD is important for various functions. Among these are site- specific RNA editing of transcripts of the glutamate receptors (see OMIM Ref. No. 138248), which are channels for the neurotransmitter L- glutamate in the brain. DSRAD also functions to modify viral RNA genomes and may be responsible for hypermutation of certain negative- stranded viruses, such as measles, which may result in lethal measles inclusion body encephalitis (Weier et al., 1995). By fluorescence in situ hybridization, Weier et al. (1995) mapped the DSRAD gene to 1q21.1- q21.2, centromeric to the marker D1S1705. Wang et al. (1995) mapped the DRADA gene to 1q21 by fluorescence in situ hybridization. By FISH, Weier et al. (2000) mapped the mouse homolog (Adar) to chromosome 3F2.

[26132] Animal model experiments lend further support to the function of ADAR. Wang et al. (2000) knocked out the Adar1 gene in mice by targeted disruption and found that heterozygosity for the Adar1 knockout causes embryonic lethality.

[26133] It is appreciated that the abovementioned animal model for ADAR is acknowledged by those skilled in the art as a

scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[26134] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26135] Weier, H.- U. G.; George, C. X.; Greulich, K. M.; Samuel, C. E. : The interferon- inducible, double- stranded RNA-specific adenosine deaminase gene (DSRAD) maps to human chromosome 1q21.1- 21.2. Genomics 30: 372- 375, 1995. ; and

[26136] Wang, Q.; Khillan, J.; Gadue, P.; Nishikura, K. : Requirement of the RNA editing deaminase ADAR1 gene for embryonic erythropoiesis. Science 290: 1765- 1768, 2000.

[26137] Further studies establishing the function and utilities of ADAR are found in John Hopkins OMIM database record ID 601059, and in cited publications listed in Table 5, which are hereby incorporated by reference.Adenosine deaminase, rna-specific (ADAR, Accession NP_056656.1) is another GAM175 target gene, herein designated TARGET GENE. ADAR BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADAR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADAR BINDING SITE, designated SEQ ID:13257, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26138] Another function of GAM175 is therefore inhibition of Adenosine deaminase, rna-specific (ADAR, Accession NP_056656.1), a gene which converts adenosine to inosine in double- stranded RNA. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAR.

[26139] The function of ADAR has been established by previous studies. Double- stranded RNA- specific adenosine deaminase (DSRAD) was identified as a developmentally regulated dsRNA unwinding activity in early antisense experiments with Xenopus oocytes (Bass and Weintraub, 1988). The enzyme converts adenosine to inosine in dsRNA, which destabilizes the dsRNA helix. The RNA modifying activity of DSRAD is important for various functions. Among these are site- specific RNA editing of transcripts of the glutamate receptors (see OMIM Ref. No. 138248), which are channels for the neurotransmitter L- glutamate in the brain. DSRAD also functions to modify viral RNA

genomes and may be responsible for hypermutation of certain negative- stranded viruses, such as measles, which may result in lethal measles inclusion body encephalitis (Weier et al., 1995). By fluorescence in situ hybridization, Weier et al. (1995) mapped the DSRAD gene to 1q21.1- q21.2, centromeric to the marker D1S1705. Wang et al. (1995) mapped the DRADA gene to 1q21 by fluorescence in situ hybridization. By FISH, Weier et al. (2000) mapped the mouse homolog (Adar) to chromosome 3F2.

[26140] Animal model experiments lend further support to the function of ADAR. Wang et al. (2000) knocked out the Adar1 gene in mice by targeted disruption and found that heterozygosity for the Adar1 knockout causes embryonic lethality.

[26141] It is appreciated that the abovementioned animal model for ADAR is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[26142] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26143] Weier, H.- U. G.; George, C. X.; Greulich, K. M.; Samuel, C.

E. : The interferon- inducible, double- stranded RNA- specific adenosine deaminase gene (DSRAD) maps to human chromosome 1q21.1- 21.2. Genomics 30: 372- 375, 1995. ; and

[26144] Wang, Q.; Khillan, J.; Gadue, P.; Nishikura, K. : Requirement of the RNA editing deaminase ADAR1 gene for embryonic erythropoiesis. Science 290: 1765- 1768, 2000.

[26145] Further studies establishing the function and utilities of ADAR are found in John Hopkins OMIM database record ID 601059, and in cited publications listed in Table 5, which are hereby incorporated by reference.AFAP (Accession NP_067651.1) is another GAM175 target gene, herein designated TARGET GENE. AFAP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AFAP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AFAP BINDING SITE, designated SEQ ID:7185, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26146] Another function of GAM175 is therefore inhibition of AFAP (Accession NP_067651.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with AFAP.

[26147] Annexin a8 (ANXA8, Accession NP_001621.1) is another GAM175 target gene, herein designated TARGET GENE. ANXA8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ANXA8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ANXA8 BINDING SITE, designated SEQ ID:15378, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26148] Another function of GAM175 is therefore inhibition of Annexin a8 (ANXA8, Accession NP_001621.1), a gene which acts as an indirect inhibitor of the thromboplastin- specific complex, which is involved in the blood coagulation cascade. and therefore may be associated with Promyelocytic leukemia locus (pml). Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of Promyelocytic leukemia locus (pml), and of other diseases and clinical conditions associated with ANXA8.

[26149] The function of ANXA8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to GAM55.2.Apoptotic protease activating factor (APAF1, Accession NP_037361.1) is another GAM175 target gene, herein designated TARGET GENE. APAF1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by APAF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APAF1 BINDING SITE, designated SEQ ID:12211, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26150] Another function of GAM175 is therefore inhibition of Apoptotic protease activating factor (APAF1, Accession NP_037361.1), a gene which functions in the mitochondrial apoptotic pathway that leads to caspase 9 dependent activation of caspase 3 and therefore may be associated with Cancer. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of Cancer, and of other diseases and clinical conditions associated with APAF1.

[26151] The function of APAF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Apoptotic protease activating factor (APAF1,

Accession NP_001151.1) is another GAM175 target gene, herein designated TARGET GENE. APAF1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by APAF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APAF1 BINDING SITE, designated SEQ ID:12211, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26152] Another function of GAM175 is therefore inhibition of Apoptotic protease activating factor (APAF1, Accession NP_001151.1), a gene which functions in the mitochondrial apoptotic pathway that leads to caspase 9 dependent activation of caspase 3 and therefore may be associated with Cancer. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of Cancer, and of other diseases and clinical conditions associated with APAF1.

[26153] The function of APAF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Apolipoprotein l, 1 (APOL1, Accession NP_003652.2) is another GAM175 target gene, herein

designated TARGET GENE. APOL1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by APOL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APOL1 BINDING SITE, designated SEQ ID:10954, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26154] Another function of GAM175 is therefore inhibition of Apolipoprotein l, 1 (APOL1, Accession NP_003652.2), a gene which may participate in reverse cholesterol transport from peripheral cells to the liver. and therefore may be associated with Schizophrenia. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of Schizophrenia, and of other diseases and clinical conditions associated with APOL1.

[26155] The function of APOL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Apolipoprotein l, 1 (APOL1, Accession NP_663319.1) is another GAM175 target gene, herein designated TARGET GENE. APOL1 BINDING SITE is a target

binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by APOL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APOL1 BINDING SITE, designated SEQ ID:10954, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26156] Another function of GAM175 is therefore inhibition of Apolipoprotein l, 1 (APOL1, Accession NP_663319.1), a gene which may participate in reverse cholesterol transport from peripheral cells to the liver. and therefore may be associated with Schizophrenia. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of Schizophrenia, and of other diseases and clinical conditions associated with APOL1.

[26157] The function of APOL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Apolipoprotein l, 1 (APOL1, Accession NP_663318.1) is another GAM175 target gene, herein designated TARGET GENE. APOL1 BINDING SITE is a target binding site found in the 3` untranslated region of multi-

ple transcripts of mRNA encoded by APOL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APOL1 BINDING SITE, designated SEQ ID:10954, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26158] Another function of GAM175 is therefore inhibition of Apolipoprotein l, 1 (APOL1, Accession NP_663318.1), a gene which may participate in reverse cholesterol transport from peripheral cells to the liver. and therefore may be associated with Schizophrenia. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of Schizophrenia, and of other diseases and clinical conditions associated with APOL1.

[26159] The function of APOL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Adp-ribosylation factor 4 (ARF4, Accession NP_001651.1) is another GAM175 target gene, herein designated TARGET GENE. ARF4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ARF4, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARF4 BINDING SITE, designated SEQ ID:16305, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26160] Another function of GAM175 is therefore inhibition of Adp-ribosylation factor 4 (ARF4, Accession NP_001651.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARF4.

[26161] Rho/rac guanine nucleotide exchange factor (gef) 2 (ARHGEF2, Accession NP_004714.2) is another GAM175 target gene, herein designated TARGET GENE. ARHGEF2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ARHGEF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARHGEF2 BINDING SITE, designated SEQ ID:10786, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26162] Another function of GAM175 is therefore inhibition of

Rho/rac guanine nucleotide exchange factor (gef) 2 (ARHGEF2, Accession NP_004714.2) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF2.

[26163] Cdc42 guanine nucleotide exchange factor (gef) 9 (ARHGEF9, Accession NP_056000.1) is another GAM175 target gene, herein designated TARGET GENE. ARHGEF9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ARHGEF9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARHGEF9 BINDING SITE, designated SEQ ID:527, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26164] Another function of GAM175 is therefore inhibition of Cdc42 guanine nucleotide exchange factor (gef) 9 (ARHGEF9, Accession NP_056000.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF9.

[26165] Aryl-hydrocarbon receptor nuclear translocator 2 (ARNT2,

Accession NP_055677.1) is another GAM175 target gene, herein designated TARGET GENE. ARNT2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ARNT2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARNT2 BINDING SITE, designated SEQ ID:16746, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26166] Another function of GAM175 is therefore inhibition of Aryl-hydrocarbon receptor nuclear translocator 2 (ARNT2, Accession NP_055677.1), a gene which specifically recognizes the xenobiotic response element (xre). Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARNT2.

[26167] The function of ARNT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM67.1.ART5 (Accession NP_443750.2) is another GAM175 target gene, herein designated TARGET GENE. ART5 BINDING SITE is a target binding site found in the 5`

untranslated region of mRNA encoded by ART5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ART5 BINDING SITE, designated SEQ ID:13679, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26168] Another function of GAM175 is therefore inhibition of ART5 (Accession NP_443750.2) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ART5.

[26169] Chromosome 10 open reading frame 2 (C10orf2, Accession NP_068602.1) is another GAM175 target gene, herein designated TARGET GENE. C10orf2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C10orf2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C10orf2 BINDING SITE, designated SEQ ID:3494, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26170] Another function of GAM175 is therefore inhibition of

Chromosome 10 open reading frame 2 (C10orf2, Accession NP_068602.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C10orf2.

[26171] Chromosome 14 open reading frame 37 (C14orf37, Accession XP_085124.2) is another GAM175 target gene, herein designated TARGET GENE. C14orf37 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C14orf37, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf37 BINDING SITE, designated SEQ ID:18001, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26172] Another function of GAM175 is therefore inhibition of Chromosome 14 open reading frame 37 (C14orf37, Accession XP_085124.2) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf37.

[26173] Chromosome 1 open reading frame 34 (C1orf34, Accession XP_027172.1) is another GAM175 target gene, herein designated TARGET GENE. C1orf34 BINDING SITE is a tar-

get binding site found in the 3` untranslated region of mRNA encoded by C1orf34, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1orf34 BINDING SITE, designated SEQ ID:10527, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26174] Another function of GAM175 is therefore inhibition of Chromosome 1 open reading frame 34 (C1orf34, Accession XP_027172.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf34.

[26175] Chromosome 5 open reading frame 7 (C5orf7, Accession NP_057688.1) is another GAM175 target gene, herein designated TARGET GENE. C5orf7 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by C5orf7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C5orf7 BINDING SITE, designated SEQ ID:449, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26176] Another function of GAM175 is therefore inhibition of Chromosome 5 open reading frame 7 (C5orf7, Accession NP_057688.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf7.

[26177] Chemokine (c-c motif) receptor 2 (CCR2, Accession NP_000639.1) is another GAM175 target gene, herein designated TARGET GENE. CCR2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CCR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCR2 BINDING SITE, designated SEQ ID:13143, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26178] Another function of GAM175 is therefore inhibition of Chemokine (c-c motif) receptor 2 (CCR2, Accession NP_000639.1), a gene which binds chemokines and transduces a signal by increasing the intracellular calcium ions level. and therefore may be associated with Hiv- 1 infection. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of Hiv- 1 infection, and of other

diseases and clinical conditions associated with CCR2.

[26179] The function of CCR2 has been established by previous studies. Charo et al. (1994) isolated 2 cDNAs by degenerate PCR using primers for a conserved region in the second and third transmembrane domains of the MIP- 1- alpha/RANTES receptor (OMIM Ref. No. 601159) and IL- 8 receptors (146928, 146929). They then used PCR products to screen a human monocytic leukemia- cell library. The 2 cDNAs encoded putative chemokine receptors (termed A and B) that are identical except for their C termini and thus appear to result from alternative splicing. The 347- amino acid predicted protein from the A isoform, designated MCP1RA (and later termed CC CKR2A by Combadiere et al., 1995), is 51% identical to the MIP- 1- alpha/RANTES receptor. As are the other members of this receptor family, MCP1RA is a 7- transmembrane G protein- coupled receptor. Combadiere et al. (1995) demonstrated that the predominant agonist for CC CKR2A is MCP1, while both MCP1 and MCP3 (OMIM Ref. No. 158106) are ligands for the CC CKR2B isoform (Combadiere et al., 1995).

[26180] Animal model experiments lend further support to the function of CCR2. Peters et al. (2000) observed that after

immunization with Th1- inducing agents, Ccr2 - /- mice produced markedly less gamma- interferon (IFNG; 147570) after antigen- specific stimulation than did wild-type mice. In contrast, IL5 (OMIM Ref. No. 147850), IL10 (OMIM Ref. No. 124092), and IL13 (OMIM Ref. No. 147683) production was not impaired in Ccr2 - /- mice. Flow cytometric analysis showed that fewer antigen- presenting cells migrated to the immunization site or draining lymph nodes in the Ccr2 - /- mice. Peters et al. (2000) concluded that CCR2 is required for proper trafficking of antigen- presenting cells capable of inducing IFNG production by T cells.

[26181] It is appreciated that the abovementioned animal model for CCR2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[26182] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26183] Combadiere, C.; Ahuja, S. K.; Van Damme, J.; Tiffany, H. L.; Gao, J.- L.; Murphy, P. M. : Monocyte chemoattractant protein- 3 is a functional ligand for CC chemokine receptors 1 and 2B. J. Biol. Chem. 270: 29671- 29675, 1995. ;

and

[26184] Peters, W.; Dupuis, M.; Charo, I. F. : A mechanism for the impaired IFN- gamma production in C- C chemokine receptor 2 (CCR2) knockout mice: role of CCR2 in linking the innate and adaptive.

[26185] Further studies establishing the function and utilities of CCR2 are found in John Hopkins OMIM database record ID 601267, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ccr4 carbon catabolite repression 4-like (s. cerevisiae) (CCRN4L, Accession NP_036250.2) is another GAM175 target gene, herein designated TARGET GENE. CCRN4L BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CCRN4L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCRN4L BINDING SITE, designated SEQ ID:708, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26186] Another function of GAM175 is therefore inhibition of Ccr4 carbon catabolite repression 4-like (s. cerevisiae) (CCRN4L, Accession NP_036250.2) . Accordingly, utilities

of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCRN4L.

[26187] CHDC1 (Accession XP_166260.1) is another GAM175 target gene, herein designated TARGET GENE. CHDC1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CHDC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHDC1 BINDING SITE, designated SEQ ID:13850, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26188] Another function of GAM175 is therefore inhibition of CHDC1 (Accession XP_166260.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHDC1.

[26189] Carbohydrate (n-acetylglucosamine 6-o) sulfotransferase 5 (CHST5, Accession NP_036258.1) is another GAM175 target gene, herein designated TARGET GENE. CHST5 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CHST5, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHST5 BINDING SITE, designated SEQ ID:1259, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26190] Another function of GAM175 is therefore inhibition of Carbohydrate (n-acetylglucosamine 6-o) sulfotransferase 5 (CHST5, Accession NP_036258.1), a gene which may be involved in sulfation of glycoproteins and proteoglycans. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST5.

[26191] The function of CHST5 has been established by previous studies. The carbohydrates of glycoconjugates are highly diverse structures with variation in monosaccharide composition, glycosidic linkage positions, and branching of chains. Further diversity is added by the covalent addition of sulfate moieties to particular hydroxyl groups and amino groups of saccharides. The sulfate modifications of glycoproteins can be extensive in amount and frequently occur at high density. They can have a profound effect on the physiochemical properties of the glycoconjugates, at least in part through the addition of negative charge. Car-

bohydrate sulfation plays a critical role in many biologic processes. The GST family of sulfotransferases includes CHST1 (OMIM Ref. No. 603797), CHST2 (OMIM Ref. No. 603798), CHST3 (OMIM Ref. No. 603799), and LSST. These enzymes are 6- O- sulfotransferases, which add sulfate to C6 of galactose (Gal), N- acetylgalactosamine (OMIM Ref. No. GalNAc), or N- acetylglucosamine (OMIM Ref. No. Glc-NAc). By searching an EST database with the sequences of CHST1 and LSST, Lee et al. (1999) identified nonoverlapping ESTs encoding CHST5, which they called IGlcNAc6ST. They isolated additional CHST5 ESTs and assembled a complete CHST5 coding sequence. The deduced 390-amino acid CHST5 protein is predicted to be a type II transmembrane protein, with an N- terminal cytoplasmic tail of 9 residues and a single transmembrane domain. The extracellular domain contains 3 potential N- glycosylation sites. CHST5 shares 55% amino acid sequence identity with LSST, 35.8% identity with CHST1, and 76% identity with mouse Chst5, whose cDNA Lee et al. (1999) also cloned. Recombinant CHST5 expressed in mammalian cells catalyzed the addition of sulfate to C6 of GlcNAc. Lee et al. (1999) isolated the CHST5 genomic sequence. The CHST5 gene is intronless. Northern blot analysis of a vari-

ety of normal human tissues showed a major 2.8- kb CHST5 transcript at relatively high levels in colon and small intestine and at lower levels in fetal liver. Minor transcripts of 3.5, 4, 5, and 8 kb were also found in colon and small intestine. CHST5 expression was not detected in any of the other tissues tested. CHST5, encoding an intestinal sulfotransferase, is situated close to CHST6 (OMIM Ref. No. 605294), which encodes a corneal sulfotransferase and is mutant in cases of macular corneal dystrophy (OMIM Ref. No. 217800). By radiation hybrid analysis, Akama et al. (2000) mapped the CHST5 and CHST6 genes to 16q22, between markers D16S3326 and D16S3016

[26192]

[26193] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26194] Akama, T. O.; Nishida, K.; Nakayama, J.; Watanabe, H.; Ozaki, K.; Nakamura, T.; Dota, A.; Kawasaki, S.; Inoue, Y.; Maeda, N.; Yamamoto, S.; Fujiwara, T.; Thonar, E. J.- M. A.; Shimomura, Y.; Kinoshita, S.; Tanigami, A.; Fukuda, M. N. : Macular corneal dystrophy type I and type II are caused by distinct mutations in a new sulphotransferase gene. Nature Genet. 26: 237- 241, 2000. ; and

[26195] Lee, J. K.; Bhakta, S.; Rosen, S. D.; Hemmerich, S. : Cloning and characterization of a mammalian N- acetylglu- cosamine- 6- sulfotransferase that is highly restricted to intestinal tissue.

[26196] Further studies establishing the function and utilities of CHST5 are found in John Hopkins OMIM database record ID 604817, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cop9 consti- tutive photomorphogenic homolog subunit 7a (arabidopsis) (COPS7A, Accession NP_057403.1) is an- other GAM175 target gene, herein designated TARGET GENE. COPS7A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by COPS7A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu- cleotide sequences of COPS7A BINDING SITE, designated SEQ ID:15229, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26197] Another function of GAM175 is therefore inhibition of Cop9 constitutive photomorphogenic homolog subunit 7a (arabidopsis) (COPS7A, Accession NP_057403.1) . Accord-

ingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COPS7A.

[26198] Cse1 chromosome segregation 1-like (yeast) (CSE1L, Accession NP_803185.1) is another GAM175 target gene, herein designated TARGET GENE. CSE1L BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CSE1L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CSE1L BINDING SITE, designated SEQ ID:17881, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26199] Another function of GAM175 is therefore inhibition of Cse1 chromosome segregation 1-like (yeast) (CSE1L, Accession NP_803185.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSE1L.

[26200] Cse1 chromosome segregation 1-like (yeast) (CSE1L, Accession NP_001307.2) is another GAM175 target gene, herein designated TARGET GENE. CSE1L BINDING SITE is a target binding site found in the 3` untranslated region of

multiple transcripts of mRNA encoded by CSE1L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CSE1L BINDING SITE, designated SEQ ID:17881, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26201] Another function of GAM175 is therefore inhibition of Cse1 chromosome segregation 1-like (yeast) (CSE1L, Accession NP_001307.2) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSE1L.

[26202] Catenin (cadherin-associated protein), alpha 2 (CTNNA2, Accession NP_004380.1) is another GAM175 target gene, herein designated TARGET GENE. CTNNA2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CTNNA2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CTNNA2 BINDING SITE, designated SEQ ID:1392, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26203] Another function of GAM175 is therefore inhibition of Catenin (cadherin-associated protein), alpha 2 (CTNNA2, Accession NP_004380.1), a gene which is involved in the cytoplasmic anchorage of cell- cell and cell- substrate adhesion molecules. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTNNA2.

[26204] The function of CTNNA2 has been established by previous studies. Cell- cell and cell- matrix adhesions involve transmembrane glycoproteins such as cell adhesion molecules and integrins, which are thought to function via interactions of their cytoplasmic domains with proteins associated with the cytoskeleton. Vinculin (OMIM Ref. No. 193065) and talin (OMIM Ref. No. 186745) are examples. The activity of cadherins (e.g., 114020), which mediate homophilic cell- cell Ca(2+)- dependent association, depends on their anchorage to cytoskeleton via proteins termed catenins (Herrenknecht et al., 1991).

[26205] Animal model experiments lend further support to the function of CTNNA2. Mice homozygous for the 'cerebellar-deficient folia' (cdf) mutation are ataxic and have cerebellar hypoplasia and abnormal lobulation of the cerebellum (Cook et al., 1997). In the cerebella of cdf/cdf homozy-

gous mice, approximately 40% of Purkinje cells are located ectopically in the white matter and inner granule- cell layer. Many hippocampal pyramidal cells are scattered in the plexiform layers, and those that are correctly positioned are less densely packed than are cells in wildtype mice. Park et al. (2002) showed that fear conditioning and prepulse inhibition of the startle response are also disrupted in cdf/cdf mice. They identified a deletion on mouse chromosome 6 that removed approximately 150 kb of the cdf region. The deletion included part of Catna2, encoding alpha- N- catenin, a protein that links the classic cadherins to the neuronal cytoskeleton. Expression of a Catna2 transgene in cdf/cdf mice restored normal cerebellar and hippocampal morphology, prepulse inhibition, and fear conditioning. The findings suggested that catenin- cadherin cell- adhesion complexes are important in cerebellar and hippocampal lamination and in the control of startle modulation.

[26206] It is appreciated that the abovementioned animal model for CTNNA2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[26207] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[26208] Claverie, J.- M.; Hardelin, J.- P.; Legouis, R.; Levilliers, J.; Bougueleret, L.; Mattei, M.- G.; Petit, C. : Characterization and chromosomal assignment of a human cDNA encoding a protein related to the murine 102- kDa cadherin- associated protein (alpha- catenin). Genomics 15: 13- 20, 1993. ; and

[26209] Park, C.; Falls, W.; Finger, J. H.; Longo- Guess, C. M.; Ackerman, S. L. : Deletion in Catna2, encoding alpha- N-catenin, causes cerebellar and hippocampal lamination defects and impaired.

[26210] Further studies establishing the function and utilities of CTNNA2 are found in John Hopkins OMIM database record ID 114025, and in cited publications listed in Table 5, which are hereby incorporated by reference.Catenin, beta interacting protein 1 (CTNNBIP1, Accession NP_064633.1) is another GAM175 target gene, herein designated TARGET GENE. CTNNBIP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CTNNBIP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of CTNNBIP1 BINDING SITE, designated SEQ ID:17490, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26211] Another function of GAM175 is therefore inhibition of Catenin, beta interacting protein 1 (CTNNBIP1, Accession NP_064633.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTNNBIP1.

[26212] Catenin (cadherin-associated protein), delta 1 (CTNND1, Accession NP_001322.1) is another GAM175 target gene, herein designated TARGET GENE. CTNND1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CTNND1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CTNND1 BINDING SITE, designated SEQ ID:18658, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26213] Another function of GAM175 is therefore inhibition of Catenin (cadherin-associated protein), delta 1 (CTNND1, Accession NP_001322.1) . Accordingly, utilities of

GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTNND1.

[26214] Death-associated protein kinase 1 (DAPK1, Accession NP_004929.1) is another GAM175 target gene, herein designated TARGET GENE. DAPK1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DAPK1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DAPK1 BINDING SITE, designated SEQ ID:10219, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26215] Another function of GAM175 is therefore inhibition of Death-associated protein kinase 1 (DAPK1, Accession NP_004929.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAPK1.

[26216] Dna cross-link repair 1c (pso2 homolog, s. cerevisiae) (DCLRE1C, Accession NP_071932.1) is another GAM175 target gene, herein designated TARGET GENE. DCLRE1C BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DCLRE1C, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DCLRE1C BINDING SITE, designated SEQ ID:8700, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26217] Another function of GAM175 is therefore inhibition of Dna cross-link repair 1c (pso2 homolog, s. cerevisiae) (DCLRE1C, Accession NP_071932.1), a gene which intervenes in V(D)J recombination/DNA repair. and therefore may be associated with Severe combined immunodeficiency with sensitivity to ionizing radiation . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of Severe combined immunodeficiency with sensitivity to ionizing radiation ., and of other diseases and clinical conditions associated with DCLRE1C.

[26218] The function of DCLRE1C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM72.1.Diaphanous homolog 2 (drosophila) (DIAPH2, Accession NP_006720.1) is another GAM175 target gene, herein designated TARGET GENE. DIAPH2 BINDING SITE is a target binding site found in the 3` untranslated region

of multiple transcripts of mRNA encoded by DIAPH2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DIAPH2 BINDING SITE, designated SEQ ID:5513, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26219] Another function of GAM175 is therefore inhibition of Diaphanous homolog 2 (drosophila) (DIAPH2, Accession NP_006720.1), a gene which may affect in oogenesis and therefore may be associated with Premature ovarian failure . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of Premature ovarian failure ., and of other diseases and clinical conditions associated with DIAPH2.

[26220] The function of DIAPH2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM66.1.DKFZp434G179 (Accession XP_087065.1) is another GAM175 target gene, herein designated TARGET GENE. DKFZp434G179 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp434G179, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434G179 BINDING SITE, designated SEQ ID:15093, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26221] Another function of GAM175 is therefore inhibition of DKFZp434G179 (Accession XP_087065.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434G179.

[26222] DKFZP434H132 (Accession NP_056307.1) is another GAM175 target gene, herein designated TARGET GENE. DKFZP434H132 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP434H132, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434H132 BINDING SITE, designated SEQ ID:10923, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26223] Another function of GAM175 is therefore inhibition of DK-

FZP434H132 (Accession NP_056307.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434H132.

[26224] DKFZP434H2010 (Accession NP_115505.1) is another GAM175 target gene, herein designated TARGET GENE. DKFZP434H2010 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP434H2010, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434H2010 BINDING SITE, designated SEQ ID:2795, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26225] Another function of GAM175 is therefore inhibition of DKFZP434H2010 (Accession NP_115505.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434H2010.

[26226] DKFZp434K2435 (Accession NP_115632.1) is another GAM175 target gene, herein designated TARGET GENE. DKFZp434K2435 BINDING SITE is a target binding site

found in the 3` untranslated region of mRNA encoded by DKFZp434K2435, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434K2435 BINDING SITE, designated SEQ ID:6806, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26227] Another function of GAM175 is therefore inhibition of DKFZp434K2435 (Accession NP_115632.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434K2435.

[26228] DKFZp761G0122 (Accession NP_689874.1) is another GAM175 target gene, herein designated TARGET GENE. DKFZp761G0122 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp761G0122, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761G0122 BINDING SITE, designated SEQ ID:10041, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:265.

[26229] Another function of GAM175 is therefore inhibition of DKFZp761G0122 (Accession NP_689874.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761G0122.

[26230] Ectodermal dysplasia 1, anhidrotic (ED1, Accession NP_001390.1) is another GAM175 target gene, herein designated TARGET GENE. ED1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ED1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ED1 BINDING SITE, designated SEQ ID:3738, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26231] Another function of GAM175 is therefore inhibition of Ectodermal dysplasia 1, anhidrotic (ED1, Accession NP_001390.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ED1.

[26232] Endothelial differentiation, sphingolipid g-protein-coupled receptor, 1 (EDG1, Accession NP_001391.2)

is another GAM175 target gene, herein designated TARGET GENE. EDG1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by EDG1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EDG1 BINDING SITE, designated SEQ ID:5089, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26233] Another function of GAM175 is therefore inhibition of Endothelial differentiation, sphingolipid g-protein-coupled receptor, 1 (EDG1, Accession NP_001391.2) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDG1.

[26234] Epsin 2 (EPN2, Accession NP_055779.1) is another GAM175 target gene, herein designated TARGET GENE. EPN2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EPN2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EPN2 BINDING SITE, designated

SEQ ID:3856, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26235] Another function of GAM175 is therefore inhibition of Epsin 2 (EPN2, Accession NP_055779.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPN2.

[26236] Epsin 2 (EPN2, Accession NP_683723.1) is another GAM175 target gene, herein designated TARGET GENE. EPN2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EPN2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EPN2 BINDING SITE, designated SEQ ID:3856, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26237] Another function of GAM175 is therefore inhibition of Epsin 2 (EPN2, Accession NP_683723.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPN2.

[26238] Fem-1 homolog a (c.elegans) (FEM1A, Accession

NP_061178.1) is another GAM175 target gene, herein designated TARGET GENE. FEM1A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FEM1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FEM1A BINDING SITE, designated SEQ ID:18114, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26239] Another function of GAM175 is therefore inhibition of Fem-1 homolog a (c.elegans) (FEM1A, Accession NP_061178.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FEM1A.

[26240] FLJ10520 (Accession NP_060594.2) is another GAM175 target gene, herein designated TARGET GENE. FLJ10520 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10520, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10520 BINDING SITE, designated SEQ ID:2136, to the

nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26241] Another function of GAM175 is therefore inhibition of FLJ10520 (Accession NP_060594.2) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10520.

[26242] FLJ11286 (Accession NP_060851.1) is another GAM175 target gene, herein designated TARGET GENE. FLJ11286 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11286, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11286 BINDING SITE, designated SEQ ID:5419, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26243] Another function of GAM175 is therefore inhibition of FLJ11286 (Accession NP_060851.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11286.

[26244] FLJ11700 (Accession NP_079168.1) is another GAM175

target gene, herein designated TARGET GENE. FLJ11700 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11700, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11700 BINDING SITE, designated SEQ ID:12317, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26245] Another function of GAM175 is therefore inhibition of FLJ11700 (Accession NP_079168.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11700.

[26246] FLJ12242 (Accession NP_078957.1) is another GAM175 target gene, herein designated TARGET GENE. FLJ12242 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12242, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12242 BINDING SITE, designated SEQ ID:6997, to the nucleotide sequence of GAM175 RNA, herein designated

GAM RNA, also designated SEQ ID:265.

[26247] Another function of GAM175 is therefore inhibition of FLJ12242 (Accession NP_078957.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12242.

[26248] FLJ13081 (Accession NP_079110.1) is another GAM175 target gene, herein designated TARGET GENE. FLJ13081 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13081, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13081 BINDING SITE, designated SEQ ID:16448, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26249] Another function of GAM175 is therefore inhibition of FLJ13081 (Accession NP_079110.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13081.

[26250] FLJ13241 (Accession NP_079364.1) is another GAM175 target gene, herein designated TARGET GENE. FLJ13241

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13241, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13241 BINDING SITE, designated SEQ ID:14121, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26251] Another function of GAM175 is therefore inhibition of FLJ13241 (Accession NP_079364.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13241.

[26252] FLJ13544 (Accession NP_079284.1) is another GAM175 target gene, herein designated TARGET GENE. FLJ13544 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ13544, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13544 BINDING SITE, designated SEQ ID:9579, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26253] Another function of GAM175 is therefore inhibition of FLJ13544 (Accession NP_079284.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13544.

[26254] FLJ21868 (Accession NP_073606.1) is another GAM175 target gene, herein designated TARGET GENE. FLJ21868 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ21868, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21868 BINDING SITE, designated SEQ ID:10496, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26255] Another function of GAM175 is therefore inhibition of FLJ21868 (Accession NP_073606.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21868.

[26256] FLJ22167 (Accession NP_078809.2) is another GAM175 target gene, herein designated TARGET GENE. FLJ22167 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by FLJ22167, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22167 BINDING SITE, designated SEQ ID:1259, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26257] Another function of GAM175 is therefore inhibition of FLJ22167 (Accession NP_078809.2) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22167.

[26258] FLJ22578 (Accession NP_079140.1) is another GAM175 target gene, herein designated TARGET GENE. FLJ22578 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ22578, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22578 BINDING SITE, designated SEQ ID:15094, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26259] Another function of GAM175 is therefore inhibition of

FLJ22578 (Accession NP_079140.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22578.

[26260] FLJ23754 (Accession NP_689888.1) is another GAM175 target gene, herein designated TARGET GENE. FLJ23754 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23754, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23754 BINDING SITE, designated SEQ ID:543, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26261] Another function of GAM175 is therefore inhibition of FLJ23754 (Accession NP_689888.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23754.

[26262] FLJ36928 (Accession NP_775822.1) is another GAM175 target gene, herein designated TARGET GENE. FLJ36928 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ36928, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ36928 BINDING SITE, designated SEQ ID:15645, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26263] Another function of GAM175 is therefore inhibition of FLJ36928 (Accession NP_775822.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ36928.

[26264] FLJ39058 (Accession NP_775851.1) is another GAM175 target gene, herein designated TARGET GENE. FLJ39058 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ39058, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ39058 BINDING SITE, designated SEQ ID:1228, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26265] Another function of GAM175 is therefore inhibition of FLJ39058 (Accession NP_775851.1) . Accordingly, utilities

of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ39058.

[26266] FLJ39501 (Accession NP_775754.1) is another GAM175 target gene, herein designated TARGET GENE. FLJ39501 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ39501, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ39501 BINDING SITE, designated SEQ ID:7439, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26267] Another function of GAM175 is therefore inhibition of FLJ39501 (Accession NP_775754.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ39501.

[26268] Folylpolyglutamate synthase (FPGS, Accession NP_004948.2) is another GAM175 target gene, herein designated TARGET GENE. FPGS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FPGS, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FPGS BINDING SITE, designated SEQ ID:7959, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26269] Another function of GAM175 is therefore inhibition of Folylpolyglutamate synthase (FPGS, Accession NP_004948.2), a gene which is involved in conversion of folates to polyglutamate derivatives. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FPGS.

[26270] The function of FPGS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM120.1.Galactose-4-epimerase, udp- (GALE, Accession NP_000394.1) is another GAM175 target gene, herein designated TARGET GENE. GALE BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GALE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GALE BINDING SITE, designated SEQ ID:6061, to the nucleotide sequence of GAM175 RNA,

herein designated GAM RNA, also designated SEQ ID:265.

[26271] Another function of GAM175 is therefore inhibition of Galactose-4-epimerase, udp- (GALE, Accession NP_000394.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALE.

[26272] Glial fibrillary acidic protein (GFAP, Accession NP_002046.1) is another GAM175 target gene, herein designated TARGET GENE. GFAP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GFAP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GFAP BINDING SITE, designated SEQ ID:3851, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26273] Another function of GAM175 is therefore inhibition of Glial fibrillary acidic protein (GFAP, Accession NP_002046.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GFAP.

[26274] G protein-coupled receptor 44 (GPR44, Accession NP_004769.1) is another GAM175 target gene, herein

designated TARGET GENE. GPR44 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPR44, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPR44 BINDING SITE, designated SEQ ID:5220, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26275] Another function of GAM175 is therefore inhibition of G protein-coupled receptor 44 (GPR44, Accession NP_004769.1), a gene which mediates signals to the interior of the cell via activation of heterotrimeric G proteins . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR44.

[26276] The function of GPR44 has been established by previous studies. By PCR amplification of human genomic DNA using degenerate oligonucleotides corresponding to transmembrane domains 3 and 7 of the mouse delta- opioid receptor and somatostatin receptors, Marchese et al. (1999) isolated a partial cDNA for a novel G protein- coupled receptor, which they designated GPR44. They obtained a full- length clone by screening a lambda human

genomic library. GPR44 encodes a 472- amino acid protein that is closely related to chemoattractant receptors. Northern blot analysis revealed a 3.5- kb GPR44 transcript primarily in thalamus, frontal cortex, pons, and hippocampus and at lower levels in hypothalamus and caudate/putamen. A 3.4- kb transcript was detected in fetal liver, leukocytes, and thymus. Prostaglandin D2 (PGD2; OMIM Ref. No. 176803) and other prostanoids are synthesized by the constitutive cyclooxygenase COX1 (PTGS1; 176805) and its inducible isoform, COX2 (PTGS2; 600262). PGD2, which is implicated in allergic disease, elicits its biologic function through interaction with the DP receptor (PTGDR; 604687). Hirai et al. (2001) showed that PGD2 produced by activated mast cells uses CRTH2 to induce intracellular calcium mobilization and chemotaxis in Th2 cells in a G- alpha(i) (GNAI1; 139310)- dependent manner. In addition, they found that CRTH2 rather than DP mediates PGD2- dependent migration of blood eosinophils and basophils. Functional analysis indicated that PGD2 signaling through DP is coupled to G- alpha(s) (GNAS; 139320) and does not induce chemotaxis.

[26277]

[26278] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[26279] Hirai, H.; Tanaka, K.; Yoshie, O.; Ogawa, K.; Kenmotsu, K.; Takamori, Y.; Ichimasa, M.; Sugamura, K.; Nakamura, M.; Takano, S.; Nagata, K. : Prostaglandin D2 selectively induces chemotaxis in T helper type 2 cells, eosinophils, and basophils via seven- transmembrane receptor CRTH2. J. Exp. Med. 193: 255- 261, 2001. ; and

[26280] Marchese, A.; Sawzdargo, M.; Nguyen, T.; Cheng, R.; Heng, H. H. Q.; Nowak, T.; Im, D- S.; Lynch, K. R.; George, S. R.; O'Dowd, B. F. : Discovery of three novel orphan G-protein- coupled r.

[26281] Further studies establishing the function and utilities of GPR44 are found in John Hopkins OMIM database record ID 604837, and in cited publications listed in Table 5, which are hereby incorporated by reference.Germ cell associated 1 (GSG1, Accession NP_722545.1) is another GAM175 target gene, herein designated TARGET GENE. GSG1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GSG1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of GSG1 BINDING SITE, designated SEQ ID:8755, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26282] Another function of GAM175 is therefore inhibition of Germ cell associated 1 (GSG1, Accession NP_722545.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GSG1.

[26283] HCNGP (Accession NP_037392.1) is another GAM175 target gene, herein designated TARGET GENE. HCNGP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HCNGP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HCNGP BINDING SITE, designated SEQ ID:12212, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26284] Another function of GAM175 is therefore inhibition of HCNGP (Accession NP_037392.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCNGP.

[26285] Heparan sulfate 6-o-sulfotransferase 2 (HS6ST2, Acces-

sion NP_671704.2) is another GAM175 target gene, herein designated TARGET GENE. HS6ST2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HS6ST2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HS6ST2 BINDING SITE, designated SEQ ID:12074, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26286] Another function of GAM175 is therefore inhibition of Heparan sulfate 6-o-sulfotransferase 2 (HS6ST2, Accession NP_671704.2) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HS6ST2.

[26287] Interleukin 18 binding protein (IL18BP, Accession NP_766630.1) is another GAM175 target gene, herein designated TARGET GENE. IL18BP BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by IL18BP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

IL18BP BINDING SITE, designated SEQ ID:17825, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26288] Another function of GAM175 is therefore inhibition of Interleukin 18 binding protein (IL18BP, Accession NP_766630.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL18BP.

[26289] Interleukin 18 binding protein (IL18BP, Accession NP_005690.1) is another GAM175 target gene, herein designated TARGET GENE. IL18BP BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by IL18BP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL18BP BINDING SITE, designated SEQ ID:17825, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26290] Another function of GAM175 is therefore inhibition of Interleukin 18 binding protein (IL18BP, Accession NP_005690.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with IL18BP.

[26291] KIAA0193 (Accession NP_055581.2) is another GAM175 target gene, herein designated TARGET GENE. KIAA0193 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0193, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0193 BINDING SITE, designated SEQ ID:7054, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26292] Another function of GAM175 is therefore inhibition of KIAA0193 (Accession NP_055581.2) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0193.

[26293] KIAA0354 (Accession NP_055687.1) is another GAM175 target gene, herein designated TARGET GENE. KIAA0354 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0354, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

KIAA0354 BINDING SITE, designated SEQ ID:6463, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26294] Another function of GAM175 is therefore inhibition of KIAA0354 (Accession NP_055687.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0354.

[26295] KIAA0478 (Accession NP_055685.1) is another GAM175 target gene, herein designated TARGET GENE. KIAA0478 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0478, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0478 BINDING SITE, designated SEQ ID:4764, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26296] Another function of GAM175 is therefore inhibition of KIAA0478 (Accession NP_055685.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0478.

[26297] KIAA0493 (Accession XP_034717.1) is another GAM175 target gene, herein designated TARGET GENE. KIAA0493 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0493, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0493 BINDING SITE, designated SEQ ID:11550, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26298] Another function of GAM175 is therefore inhibition of KIAA0493 (Accession XP_034717.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0493.

[26299] KIAA0605 (Accession NP_055509.1) is another GAM175 target gene, herein designated TARGET GENE. KIAA0605 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0605, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0605 BINDING SITE, designated SEQ ID:9931, to the

nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26300] Another function of GAM175 is therefore inhibition of KIAA0605 (Accession NP_055509.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0605.

[26301] KIAA1671 (Accession XP_037809.1) is another GAM175 target gene, herein designated TARGET GENE. KIAA1671 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1671, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1671 BINDING SITE, designated SEQ ID:6252, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26302] Another function of GAM175 is therefore inhibition of KIAA1671 (Accession XP_037809.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1671.

[26303] KIAA1727 (Accession XP_034262.4) is another GAM175

target gene, herein designated TARGET GENE. KIAA1727 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1727, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1727 BINDING SITE, designated SEQ ID:15320, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26304] Another function of GAM175 is therefore inhibition of KIAA1727 (Accession XP_034262.4) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1727.

[26305] KIAA1804 (Accession NP_115811.1) is another GAM175 target gene, herein designated TARGET GENE. KIAA1804 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1804, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1804 BINDING SITE, designated SEQ ID:13721, to the nucleotide sequence of GAM175 RNA, herein designated

GAM RNA, also designated SEQ ID:265.

[26306] Another function of GAM175 is therefore inhibition of KIAA1804 (Accession NP_115811.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1804.

[26307] KIAA1858 (Accession XP_040592.3) is another GAM175 target gene, herein designated TARGET GENE. KIAA1858 BINDING SITE1 and KIAA1858 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA1858, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1858 BINDING SITE1 and KIAA1858 BINDING SITE2, designated SEQ ID:7750 and SEQ ID:4361 respectively, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26308] Another function of GAM175 is therefore inhibition of KIAA1858 (Accession XP_040592.3) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1858.

[26309] Klotho (KL, Accession NP_710150.1) is another GAM175 target gene, herein designated TARGET GENE. KL BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KL BINDING SITE, designated SEQ ID:5056, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26310] Another function of GAM175 is therefore inhibition of Klotho (KL, Accession NP_710150.1), a gene which has similarity to beta- glucosidases. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KL.

[26311] The function of KL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM48.2.Klotho (KL, Accession NP_004786.2) is another GAM175 target gene, herein designated TARGET GENE. KL BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KL, corresponding to a target binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KL BINDING SITE, designated SEQ ID:5056, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26312] Another function of GAM175 is therefore inhibition of Klotho (KL, Accession NP_004786.2), a gene which has similarity to beta- glucosidases. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KL.

[26313] The function of KL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM48.2.Kelch-like 3 (drosophila) (KLHL3, Accession NP_059111.1) is another GAM175 target gene, herein designated TARGET GENE. KLHL3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KLHL3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KLHL3 BINDING SITE, designated SEQ ID:2953, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26314] Another function of GAM175 is therefore inhibition of Kelch-like 3 (drosophila) (KLHL3, Accession NP_059111.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL3.

[26315] Keratin associated protein 4-12 (KRTAP4-12, Accession NP_114060.1) is another GAM175 target gene, herein designated TARGET GENE. KRTAP4-12 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KRTAP4-12, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KRTAP4-12 BINDING SITE, designated SEQ ID:7123, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26316] Another function of GAM175 is therefore inhibition of Keratin associated protein 4-12 (KRTAP4-12, Accession NP_114060.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KRTAP4-12.

[26317] Laminin, alpha 4 (LAMA4, Accession NP_002281.1) is another GAM175 target gene, herein designated TARGET

GENE. LAMA4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LAMA4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LAMA4 BINDING SITE, designated SEQ ID:11842, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26318] Another function of GAM175 is therefore inhibition of Laminin, alpha 4 (LAMA4, Accession NP_002281.1), a gene which mediates the attachment, migration and organization of cells into tissues. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAMA4.

[26319] The function of LAMA4 has been established by previous studies. Laminin, a multidomain glycoprotein, is the major noncollagenous constituent of basement membranes. It is composed of 3 nonidentical chains: A (OMIM Ref. No. 150320), B1 (OMIM Ref. No. 150240), and B2 (OMIM Ref. No. 150290). The laminins form a cruciform structure consisting of 3 short arms, each of which is formed from different chains, and a long arm composed of all 3 chains.

By screening a human keratinocyte cDNA library for type VII collagen sequences, Richards et al. (1994) isolated a new laminin alpha chain variant gene, LAMA4 (formerly called LAMA3). Northern blot analysis indicated that a cDNA encoding LAMA4 hybridized to a 6.45- kb mRNA, significantly smaller than the 9.5- to 10- kb mRNA of laminin A (Haaparanta et al., 1991). Using PCR on genomic DNA, flow- sorted chromosomes, and fluorescence in situ hybridization, Richards et al. (1994) localized the LAMA4 gene to human chromosome 6q21. In this abstract, the authors referred to the gene as LAMA3; in the related article, Richards et al. (1994) used the corrected symbol, LAMA4. Iivanainen et al. (1995) cloned the laminin alpha- 4 cDNA by screening a fetal lung library with a PCR product generated from primers based on a partial laminin- like sequence reported by GenBank. The complete cDNA is approximately 6.2 kb long and encodes a predicted protein of 1,816 amino acids. The domain structure of the protein is similar to the alpha- 3 chain (LAMA3, also called BM600), both of which resemble truncated versions of alpha- 1 and alpha- 2 in which approximately 1,200 residues at the amino end have been lost. Northern blots showed strong expression of the mRNA in

adult heart, lung, ovary, small and large intestines, liver, and placenta.

[26320]

[26321] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26322] Iivanainen, A.; Sainio, K.; Sariola, H.; Tryggvason, K. : Primary structure and expression of a novel human laminin alpha- 4 chain. FEBS Lett. 365: 183- 188, 1995. ; and

[26323] Richards, A. J.; Al- Imara, L.; Carter, N. P.; Lloyd, J. C.; Leversha, M. A.; Pope, F. M. : Localization of the gene (LAMA4) to chromosome 6q21 and isolation of a partial cDNA encoding a.

[26324] Further studies establishing the function and utilities of LAMA4 are found in John Hopkins OMIM database record ID 600133, and in cited publications listed in Table 5, which are hereby incorporated by reference.Laminin, gamma 1 (formerly lamb2) (LAMC1, Accession NP_002284.2) is another GAM175 target gene, herein designated TARGET GENE. LAMC1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LAMC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LAMC1 BINDING SITE, designated SEQ ID:18303, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26325] Another function of GAM175 is therefore inhibition of Laminin, gamma 1 (formerly lamb2) (LAMC1, Accession NP_002284.2), a gene which may mediate the attachment, migration, and organization of cells into tissues. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAMC1.

[26326] The function of LAMC1 has been established by previous studies. Laminin is a heterotrimeric extracellular matrix protein consisting of 3 chains: alpha (LAMA1; 150320), beta (LAMB1; 150240), and gamma (formerly A, B1, and B2, respectively). Several isoforms of each chain have been identified. Laminin gamma- 1 is the most ubiquitously expressed laminin subunit (Burgeson et al., 1994; Miner et al., 1997). In mouse, the laminin subunits alpha- 1, beta- 1, and gamma- 1 are expressed in the preimplantation embryo before the appearance of the first basement membrane of the trophectodermal epithelium. Smyth et

al. (1999) targeted the LAMC1 gene by homologous recombination in mouse embryonic stem (ES) cells. Mice heterozygous for the mutation had a normal phenotype and were fertile, whereas homozygous mutant embryos did not survive beyond day 5.5 postcoitum. These embryos lacked basement membranes, and although the blastocysts had expanded, primitive endoderm cells remained in the inner mass, and the parietal yolk sac did not develop. Cultured ES cells appeared normal after targeting both LAMC1 genes, but the embryoid bodies derived from them also lacked basement membranes, having disorganized extracellular deposits of the basement membrane proteins collagen IV and perlecan, and the cells failed to differentiate into stable myotubes. Nomenclature: Burgeson et al. (1994), a group of 14 leading researchers in the field of connective tissue proteins, adopted a new nomenclature for the laminins. They were numbered with arabic numerals in the order discovered. The previous A, B1, and B2 chains, and their isoforms, are alpha, beta, and gamma, respectively, followed by an arabic numeral to identify the isoform. For example, the first laminin identified from the Engelbreth- Holm- Swarm tumor (EHS) was designated laminin- 1 with the chain composition alpha-

1/beta- 1/gamma- 1. The genes for these 3 chains are LAMA1, LAMB1 (OMIM Ref. No. 150240), and LAMC1.

[26327]

[26328] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26329] Smyth, N.; Vatansever, H. S.; Murray, P.; Meyer, M.; Frie, C.; Paulsson, M.; Edgar, D. : Absence of basement membranes after targeting the LAMC1 gene results in embryonic lethality due to failure of endoderm differentiation. J. Cell Biol. 144: 151- 160, 1999. ; and

[26330] Burgeson, R. E.; Chiquet, M.; Deutzmann, R.; Ekblom, P.; Engel, J.; Kleinman, H.; Martin, G. R.; Meneguzzi, G.; Paulsson, M.; Sanes, J.; Timpl, R.; Tryggvason, K.; Yamada, Y.; Yurchenco.

[26331] Further studies establishing the function and utilities of LAMC1 are found in John Hopkins OMIM database record ID 150290, and in cited publications listed in Table 5, which are hereby incorporated by reference.Lymphocyte cytosolic protein 2 (sh2 domain containing leukocyte protein of 76kda) (LCP2, Accession NP_005556.1) is another GAM175 target gene, herein designated TARGET GENE. LCP2 BINDING SITE is a target binding site found in the 3`

untranslated region of mRNA encoded by LCP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LCP2 BINDING SITE, designated SEQ ID:2817, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26332] Another function of GAM175 is therefore inhibition of Lymphocyte cytosolic protein 2 (sh2 domain containing leukocyte protein of 76kda) (LCP2, Accession NP_005556.1), a gene which involved in t cell antigen receptor mediated signaling. and therefore may be associated with Fetal hemorrhage and platelet dysfunction. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of Fetal hemorrhage and platelet dysfunction, and of other diseases and clinical conditions associated with LCP2.

[26333] The function of LCP2 has been established by previous studies. Activation of tyrosine kinases of the src and syk family is required for T- cell receptor- mediated signaling. Jackman et al. (1995) identified a 76- kD protein that associates with the Grb2 adaptor protein (OMIM Ref. No. 108355) and is a substrate for tyrosine kinase in the acti-

vation pathway. The SLP76 (SH2 domain- containing leukocyte protein of 76 kD) cDNA encodes a predicted 533- amino acid protein with a single C- terminal Src homology 2 (SH2) domain, a proline- rich region with a binding site for Grb2, and an acidic N- terminal region with tyrosines that are phosphorylated after T- cell receptor engagement (Sunden et al., 1996). The human and mouse amino acid sequences are 84% identical. Northern blots demonstrated expression in peripheral blood leukocytes, thymus, and spleen and in human T- cell, B- cell, and monocytic cell lines. Recombinantly expressed SLP76 was shown to associate with a GST/Grb2 fusion protein. Overexpression of SLP76 has also been shown to enhance the activity of the promoter for the IL2 gene (Motto et al., 1996). Sunden et al. (1996) used a monochromosomal somatic cell hybrid panel to map the gene, designated LCP2, to chromosome 5. A 2- allele polymorphism within the gene was then used to map the locus genetically near the marker D5S429, which has been assigned to 5q33.1- qter

[26334] Animal model experiments lend further support to the function of LCP2. Clements et al. (1999) described fetal hemorrhage and perinatal mortality in mice deficient in SLP76. Although megakaryocyte and platelet development

proceeded normally in the absence of SLP76, collagen-induced platelet aggregation and granule release were markedly impaired. Furthermore, treatment of SLP76- deficient platelets with collagen failed to elicit tyrosine phosphorylation of phospholipase C- gamma- 2, suggesting that SLP76 functions upstream of PLC- gamma- 2 activation. The data provided a potential mechanism for the fetal hemorrhage observed in the SLP76- deficient mice and showed that SLP76 expression is required for optimal receptor- mediated signal transduction in platelets as well as in T lymphocytes.

[26335] It is appreciated that the abovementioned animal model for LCP2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[26336] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26337] Clements, J. L.; Lee, J. R.; Gross, B.; Yang, B.; Olson, J. D.; Sandra, A.; Watson, S. P.; Lentz, S. R.; Koretzky, G. A. : Fetal hemorrhage and platelet dysfunction in SLP- 76- deficient mice. J. Clin. Invest. 103: 19- 25, 1999. ; and

[26338] Sunden, S. L. F.; Carr, L. L.; Clements, J. L.; Motto, D. G.;

Koretzky, G. A. : Polymorphism in and localization of the gene LCP2 (SLP- 76) to chromosome 5q33.1- qter. Genomics 35: 269- 270.

[26339] Further studies establishing the function and utilities of LCP2 are found in John Hopkins OMIM database record ID 601603, and in cited publications listed in Table 5, which are hereby incorporated by reference.LOC118461 (Accession XP_060969.2) is another GAM175 target gene, herein designated TARGET GENE. LOC118461 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC118461, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC118461 BINDING SITE, designated SEQ ID:9284, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26340] Another function of GAM175 is therefore inhibition of LOC118461 (Accession XP_060969.2) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118461.

[26341] LOC122282 (Accession XP_063046.4) is another GAM175

target gene, herein designated TARGET GENE. LOC122282 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC122282, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC122282 BINDING SITE, designated SEQ ID:13483, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26342] Another function of GAM175 is therefore inhibition of LOC122282 (Accession XP_063046.4) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122282.

[26343] LOC125115 (Accession XP_064442.3) is another GAM175 target gene, herein designated TARGET GENE. LOC125115 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC125115, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC125115 BINDING SITE, designated SEQ ID:16189, to the nucleotide sequence of GAM175 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:265.

[26344] Another function of GAM175 is therefore inhibition of LOC125115 (Accession XP_064442.3) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC125115.

[26345] LOC145609 (Accession XP_096817.1) is another GAM175 target gene, herein designated TARGET GENE. LOC145609 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC145609, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145609 BINDING SITE, designated SEQ ID:4216, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26346] Another function of GAM175 is therefore inhibition of LOC145609 (Accession XP_096817.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145609.

[26347] LOC147381 (Accession XP_097230.2) is another GAM175 target gene, herein designated TARGET GENE. LOC147381

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC147381, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147381 BINDING SITE, designated SEQ ID:3191, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26348] Another function of GAM175 is therefore inhibition of LOC147381 (Accession XP_097230.2) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147381.

[26349] LOC150933 (Accession XP_097971.1) is another GAM175 target gene, herein designated TARGET GENE. LOC150933 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150933, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150933 BINDING SITE, designated SEQ ID:17201, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26350] Another function of GAM175 is therefore inhibition of LOC150933 (Accession XP_097971.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150933.

[26351] LOC151201 (Accession XP_098021.1) is another GAM175 target gene, herein designated TARGET GENE. LOC151201 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC151201, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151201 BINDING SITE, designated SEQ ID:4667, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26352] Another function of GAM175 is therefore inhibition of LOC151201 (Accession XP_098021.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151201.

[26353] LOC153077 (Accession XP_098307.1) is another GAM175 target gene, herein designated TARGET GENE. LOC153077 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC153077, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153077 BINDING SITE, designated SEQ ID:2394, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26354] Another function of GAM175 is therefore inhibition of LOC153077 (Accession XP_098307.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153077.

[26355] LOC153346 (Accession XP_098364.1) is another GAM175 target gene, herein designated TARGET GENE. LOC153346 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC153346, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153346 BINDING SITE, designated SEQ ID:19725, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26356] Another function of GAM175 is therefore inhibition of

LOC153346 (Accession XP_098364.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153346.

[26357] LOC157858 (Accession XP_098833.2) is another GAM175 target gene, herein designated TARGET GENE. LOC157858 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC157858, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC157858 BINDING SITE, designated SEQ ID:11755, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26358] Another function of GAM175 is therefore inhibition of LOC157858 (Accession XP_098833.2) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157858.

[26359] LOC158563 (Accession XP_088606.1) is another GAM175 target gene, herein designated TARGET GENE. LOC158563 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC158563, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158563 BINDING SITE, designated SEQ ID:3708, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26360] Another function of GAM175 is therefore inhibition of LOC158563 (Accession XP_088606.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158563.

[26361] LOC158833 (Accession XP_088691.1) is another GAM175 target gene, herein designated TARGET GENE. LOC158833 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC158833, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158833 BINDING SITE, designated SEQ ID:4444, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26362] Another function of GAM175 is therefore inhibition of LOC158833 (Accession XP_088691.1) . Accordingly, utili-

ties of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158833.

[26363] LOC162083 (Accession XP_091339.2) is another GAM175 target gene, herein designated TARGET GENE. LOC162083 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC162083, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC162083 BINDING SITE, designated SEQ ID:9512, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26364] Another function of GAM175 is therefore inhibition of LOC162083 (Accession XP_091339.2) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162083.

[26365] LOC197342 (Accession XP_113869.1) is another GAM175 target gene, herein designated TARGET GENE. LOC197342 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC197342, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC197342 BINDING SITE, designated SEQ ID:14413, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26366] Another function of GAM175 is therefore inhibition of LOC197342 (Accession XP_113869.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197342.

[26367] LOC200197 (Accession XP_114148.1) is another GAM175 target gene, herein designated TARGET GENE. LOC200197 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC200197, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200197 BINDING SITE, designated SEQ ID:4520, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26368] Another function of GAM175 is therefore inhibition of LOC200197 (Accession XP_114148.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC200197.

[26369] LOC201725 (Accession XP_114370.1) is another GAM175 target gene, herein designated TARGET GENE. LOC201725 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC201725, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC201725 BINDING SITE, designated SEQ ID:3083, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26370] Another function of GAM175 is therefore inhibition of LOC201725 (Accession XP_114370.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201725.

[26371] LOC219700 (Accession XP_167570.1) is another GAM175 target gene, herein designated TARGET GENE. LOC219700 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC219700, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC219700 BINDING SITE, designated SEQ ID:7954, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26372] Another function of GAM175 is therefore inhibition of LOC219700 (Accession XP_167570.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219700.

[26373] LOC253142 (Accession XP_173229.1) is another GAM175 target gene, herein designated TARGET GENE. LOC253142 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC253142, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC253142 BINDING SITE, designated SEQ ID:6541, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26374] Another function of GAM175 is therefore inhibition of LOC253142 (Accession XP_173229.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC253142.

[26375] LOC282915 (Accession XP_212579.1) is another GAM175 target gene, herein designated TARGET GENE. LOC282915 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC282915, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC282915 BINDING SITE, designated SEQ ID:11235, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26376] Another function of GAM175 is therefore inhibition of LOC282915 (Accession XP_212579.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC282915.

[26377] LOC282951 (Accession XP_212627.1) is another GAM175 target gene, herein designated TARGET GENE. LOC282951 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC282951, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC282951 BINDING SITE, designated SEQ ID:11235, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26378] Another function of GAM175 is therefore inhibition of LOC282951 (Accession XP_212627.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC282951.

[26379] LOC282976 (Accession XP_210838.1) is another GAM175 target gene, herein designated TARGET GENE. LOC282976 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC282976, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC282976 BINDING SITE, designated SEQ ID:4866, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26380] Another function of GAM175 is therefore inhibition of LOC282976 (Accession XP_210838.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC282976.

[26381] LOC283126 (Accession XP_210900.1) is another GAM175 target gene, herein designated TARGET GENE. LOC283126 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283126, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283126 BINDING SITE, designated SEQ ID:17440, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26382] Another function of GAM175 is therefore inhibition of LOC283126 (Accession XP_210900.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283126.

[26383] LOC283142 (Accession XP_210925.1) is another GAM175 target gene, herein designated TARGET GENE. LOC283142 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283142, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283142 BINDING SITE, designated SEQ ID:2594, to

the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26384] Another function of GAM175 is therefore inhibition of LOC283142 (Accession XP_210925.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283142.

[26385] LOC283482 (Accession XP_211061.1) is another GAM175 target gene, herein designated TARGET GENE. LOC283482 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283482, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283482 BINDING SITE, designated SEQ ID:15588, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26386] Another function of GAM175 is therefore inhibition of LOC283482 (Accession XP_211061.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283482.

[26387] LOC283672 (Accession XP_211152.1) is another GAM175

target gene, herein designated TARGET GENE. LOC283672 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283672, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283672 BINDING SITE, designated SEQ ID:11064, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26388] Another function of GAM175 is therefore inhibition of LOC283672 (Accession XP_211152.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283672.

[26389] LOC283859 (Accession XP_211235.1) is another GAM175 target gene, herein designated TARGET GENE. LOC283859 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283859, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283859 BINDING SITE, designated SEQ ID:15537, to the nucleotide sequence of GAM175 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:265.

[26390] Another function of GAM175 is therefore inhibition of LOC283859 (Accession XP_211235.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283859.

[26391] LOC284080 (Accession XP_211322.1) is another GAM175 target gene, herein designated TARGET GENE. LOC284080 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284080, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284080 BINDING SITE, designated SEQ ID:17268, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26392] Another function of GAM175 is therefore inhibition of LOC284080 (Accession XP_211322.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284080.

[26393] LOC284116 (Accession XP_211338.2) is another GAM175 target gene, herein designated TARGET GENE. LOC284116

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284116, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284116 BINDING SITE, designated SEQ ID:9262, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26394] Another function of GAM175 is therefore inhibition of LOC284116 (Accession XP_211338.2) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284116.

[26395] LOC284296 (Accession NP_787104.1) is another GAM175 target gene, herein designated TARGET GENE. LOC284296 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284296, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284296 BINDING SITE, designated SEQ ID:17027, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26396] Another function of GAM175 is therefore inhibition of LOC284296 (Accession NP_787104.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284296.

[26397] LOC284462 (Accession XP_211475.1) is another GAM175 target gene, herein designated TARGET GENE. LOC284462 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284462, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284462 BINDING SITE, designated SEQ ID:5767, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26398] Another function of GAM175 is therefore inhibition of LOC284462 (Accession XP_211475.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284462.

[26399] LOC284568 (Accession XP_209263.1) is another GAM175 target gene, herein designated TARGET GENE. LOC284568 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC284568, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284568 BINDING SITE, designated SEQ ID:11550, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26400] Another function of GAM175 is therefore inhibition of LOC284568 (Accession XP_209263.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284568.

[26401] LOC284865 (Accession XP_211672.1) is another GAM175 target gene, herein designated TARGET GENE. LOC284865 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284865, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284865 BINDING SITE, designated SEQ ID:8040, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26402] Another function of GAM175 is therefore inhibition of

LOC284865 (Accession XP_211672.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284865.

[26403] LOC284982 (Accession XP_211721.1) is another GAM175 target gene, herein designated TARGET GENE. LOC284982 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284982, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284982 BINDING SITE, designated SEQ ID:17065, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26404] Another function of GAM175 is therefore inhibition of LOC284982 (Accession XP_211721.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284982.

[26405] LOC284993 (Accession XP_211722.1) is another GAM175 target gene, herein designated TARGET GENE. LOC284993 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284993, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284993 BINDING SITE, designated SEQ ID:10924, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26406] Another function of GAM175 is therefore inhibition of LOC284993 (Accession XP_211722.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284993.

[26407] LOC285026 (Accession XP_209440.1) is another GAM175 target gene, herein designated TARGET GENE. LOC285026 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285026, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285026 BINDING SITE, designated SEQ ID:19445, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26408] Another function of GAM175 is therefore inhibition of LOC285026 (Accession XP_209440.1) . Accordingly, utili-

ties of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285026.

[26409] LOC285222 (Accession XP_211809.1) is another GAM175 target gene, herein designated TARGET GENE. LOC285222 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285222, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285222 BINDING SITE, designated SEQ ID:17158, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26410] Another function of GAM175 is therefore inhibition of LOC285222 (Accession XP_211809.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285222.

[26411] LOC285229 (Accession XP_211812.1) is another GAM175 target gene, herein designated TARGET GENE. LOC285229 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285229, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285229 BINDING SITE, designated SEQ ID:6284, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26412] Another function of GAM175 is therefore inhibition of LOC285229 (Accession XP_211812.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285229.

[26413] LOC285231 (Accession XP_211813.1) is another GAM175 target gene, herein designated TARGET GENE. LOC285231 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285231, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285231 BINDING SITE, designated SEQ ID:2395, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26414] Another function of GAM175 is therefore inhibition of LOC285231 (Accession XP_211813.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC285231.

[26415] LOC285246 (Accession XP_208303.1) is another GAM175 target gene, herein designated TARGET GENE. LOC285246 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285246, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285246 BINDING SITE, designated SEQ ID:1260, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26416] Another function of GAM175 is therefore inhibition of LOC285246 (Accession XP_208303.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285246.

[26417] LOC285388 (Accession XP_208316.1) is another GAM175 target gene, herein designated TARGET GENE. LOC285388 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285388, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC285388 BINDING SITE, designated SEQ ID:8111, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26418] Another function of GAM175 is therefore inhibition of LOC285388 (Accession XP_208316.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285388.

[26419] LOC285438 (Accession XP_209613.1) is another GAM175 target gene, herein designated TARGET GENE. LOC285438 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285438, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285438 BINDING SITE, designated SEQ ID:10871, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26420] Another function of GAM175 is therefore inhibition of LOC285438 (Accession XP_209613.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC285438.

[26421] LOC285486 (Accession XP_209633.1) is another GAM175 target gene, herein designated TARGET GENE. LOC285486 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285486, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285486 BINDING SITE, designated SEQ ID:8485, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26422] Another function of GAM175 is therefore inhibition of LOC285486 (Accession XP_209633.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285486.

[26423] LOC285602 (Accession XP_209676.1) is another GAM175 target gene, herein designated TARGET GENE. LOC285602 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285602, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC285602 BINDING SITE, designated SEQ ID:12446, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26424] Another function of GAM175 is therefore inhibition of LOC285602 (Accession XP_209676.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285602.

[26425] LOC285745 (Accession XP_212007.1) is another GAM175 target gene, herein designated TARGET GENE. LOC285745 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285745, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285745 BINDING SITE, designated SEQ ID:19064, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26426] Another function of GAM175 is therefore inhibition of LOC285745 (Accession XP_212007.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285745.

[26427] LOC285747 (Accession XP_209742.1) is another GAM175 target gene, herein designated TARGET GENE. LOC285747 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285747, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285747 BINDING SITE, designated SEQ ID:1009, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26428] Another function of GAM175 is therefore inhibition of LOC285747 (Accession XP_209742.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285747.

[26429] LOC285786 (Accession XP_208349.1) is another GAM175 target gene, herein designated TARGET GENE. LOC285786 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285786, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285786 BINDING SITE, designated SEQ ID:19355, to

the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26430] Another function of GAM175 is therefore inhibition of LOC285786 (Accession XP_208349.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285786.

[26431] LOC285805 (Accession XP_212027.1) is another GAM175 target gene, herein designated TARGET GENE. LOC285805 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285805, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285805 BINDING SITE, designated SEQ ID:6025, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26432] Another function of GAM175 is therefore inhibition of LOC285805 (Accession XP_212027.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285805.

[26433] LOC285833 (Accession XP_209790.1) is another GAM175

target gene, herein designated TARGET GENE. LOC285833 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285833, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285833 BINDING SITE, designated SEQ ID:11235, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26434] Another function of GAM175 is therefore inhibition of LOC285833 (Accession XP_209790.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285833.

[26435] LOC285945 (Accession XP_212092.1) is another GAM175 target gene, herein designated TARGET GENE. LOC285945 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285945, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285945 BINDING SITE, designated SEQ ID:20077, to the nucleotide sequence of GAM175 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:265.

[26436] Another function of GAM175 is therefore inhibition of LOC285945 (Accession XP_212092.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285945.

[26437] LOC285992 (Accession XP_212126.1) is another GAM175 target gene, herein designated TARGET GENE. LOC285992 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285992, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285992 BINDING SITE, designated SEQ ID:9866, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26438] Another function of GAM175 is therefore inhibition of LOC285992 (Accession XP_212126.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285992.

[26439] LOC286002 (Accession XP_212132.1) is another GAM175 target gene, herein designated TARGET GENE. LOC286002

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286002, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286002 BINDING SITE, designated SEQ ID:12015, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26440] Another function of GAM175 is therefore inhibition of LOC286002 (Accession XP_212132.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286002.

[26441] LOC286132 (Accession XP_212194.1) is another GAM175 target gene, herein designated TARGET GENE. LOC286132 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286132, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286132 BINDING SITE, designated SEQ ID:4900, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26442] Another function of GAM175 is therefore inhibition of LOC286132 (Accession XP_212194.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286132.

[26443] LOC286214 (Accession XP_212231.1) is another GAM175 target gene, herein designated TARGET GENE. LOC286214 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286214, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286214 BINDING SITE, designated SEQ ID:2319, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26444] Another function of GAM175 is therefore inhibition of LOC286214 (Accession XP_212231.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286214.

[26445] LOC286471 (Accession XP_210061.1) is another GAM175 target gene, herein designated TARGET GENE. LOC286471 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC286471, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286471 BINDING SITE, designated SEQ ID:5576, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26446] Another function of GAM175 is therefore inhibition of LOC286471 (Accession XP_210061.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286471.

[26447] LOC338565 (Accession XP_294653.1) is another GAM175 target gene, herein designated TARGET GENE. LOC338565 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC338565, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338565 BINDING SITE, designated SEQ ID:10504, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26448] Another function of GAM175 is therefore inhibition of

LOC338565 (Accession XP_294653.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338565.

[26449] LOC338585 (Accession XP_294658.1) is another GAM175 target gene, herein designated TARGET GENE. LOC338585 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC338585, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338585 BINDING SITE, designated SEQ ID:9293, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26450] Another function of GAM175 is therefore inhibition of LOC338585 (Accession XP_294658.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338585.

[26451] LOC339071 (Accession XP_294800.1) is another GAM175 target gene, herein designated TARGET GENE. LOC339071 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339071, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339071 BINDING SITE, designated SEQ ID:11684, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26452] Another function of GAM175 is therefore inhibition of LOC339071 (Accession XP_294800.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339071.

[26453] LOC339152 (Accession XP_294829.1) is another GAM175 target gene, herein designated TARGET GENE. LOC339152 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339152, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339152 BINDING SITE, designated SEQ ID:18348, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26454] Another function of GAM175 is therefore inhibition of LOC339152 (Accession XP_294829.1) . Accordingly, utili-

ties of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339152.

[26455] LOC339666 (Accession XP_295024.1) is another GAM175 target gene, herein designated TARGET GENE. LOC339666 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339666, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339666 BINDING SITE, designated SEQ ID:4270, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26456] Another function of GAM175 is therefore inhibition of LOC339666 (Accession XP_295024.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339666.

[26457] LOC339831 (Accession XP_295080.1) is another GAM175 target gene, herein designated TARGET GENE. LOC339831 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339831, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339831 BINDING SITE, designated SEQ ID:7585, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26458] Another function of GAM175 is therefore inhibition of LOC339831 (Accession XP_295080.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339831.

[26459] LOC339834 (Accession NP_835467.1) is another GAM175 target gene, herein designated TARGET GENE. LOC339834 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by LOC339834, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339834 BINDING SITE, designated SEQ ID:14967, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26460] Another function of GAM175 is therefore inhibition of LOC339834 (Accession NP_835467.1) . Accordingly, utili-

ties of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339834.

[26461] LOC339834 (Accession XP_291033.1) is another GAM175 target gene, herein designated TARGET GENE. LOC339834 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by LOC339834, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339834 BINDING SITE, designated SEQ ID:14967, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26462] Another function of GAM175 is therefore inhibition of LOC339834 (Accession XP_291033.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339834.

[26463] LOC339872 (Accession XP_291050.1) is another GAM175 target gene, herein designated TARGET GENE. LOC339872 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339872, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339872 BINDING SITE, designated SEQ ID:5152, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26464] Another function of GAM175 is therefore inhibition of LOC339872 (Accession XP_291050.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339872.

[26465] LOC340090 (Accession XP_295154.1) is another GAM175 target gene, herein designated TARGET GENE. LOC340090 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC340090, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340090 BINDING SITE, designated SEQ ID:10984, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26466] Another function of GAM175 is therefore inhibition of LOC340090 (Accession XP_295154.1) . Accordingly, utili-

ties of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340090.

[26467] LOC340397 (Accession XP_295237.1) is another GAM175 target gene, herein designated TARGET GENE. LOC340397 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC340397, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340397 BINDING SITE, designated SEQ ID:11433, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26468] Another function of GAM175 is therefore inhibition of LOC340397 (Accession XP_295237.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340397.

[26469] LOC340408 (Accession XP_291274.1) is another GAM175 target gene, herein designated TARGET GENE. LOC340408 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC340408, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340408 BINDING SITE, designated SEQ ID:14607, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26470] Another function of GAM175 is therefore inhibition of LOC340408 (Accession XP_291274.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340408.

[26471] LOC340895 (Accession XP_295865.1) is another GAM175 target gene, herein designated TARGET GENE. LOC340895 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC340895, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340895 BINDING SITE, designated SEQ ID:10036, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26472] Another function of GAM175 is therefore inhibition of LOC340895 (Accession XP_295865.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC340895.

[26473] LOC342125 (Accession XP_292375.1) is another GAM175 target gene, herein designated TARGET GENE. LOC342125 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC342125, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC342125 BINDING SITE, designated SEQ ID:12487, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26474] Another function of GAM175 is therefore inhibition of LOC342125 (Accession XP_292375.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC342125.

[26475] LOC347240 (Accession XP_294563.2) is another GAM175 target gene, herein designated TARGET GENE. LOC347240 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC347240, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC347240 BINDING SITE, designated SEQ ID:8399, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26476] Another function of GAM175 is therefore inhibition of LOC347240 (Accession XP_294563.2) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC347240.

[26477] LOC347759 (Accession XP_084325.1) is another GAM175 target gene, herein designated TARGET GENE. LOC347759 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC347759, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC347759 BINDING SITE, designated SEQ ID:5676, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26478] Another function of GAM175 is therefore inhibition of LOC347759 (Accession XP_084325.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC347759.

[26479] LOC348158 (Accession XP_300646.1) is another GAM175 target gene, herein designated TARGET GENE. LOC348158 BINDING SITE1 and LOC348158 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC348158, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348158 BINDING SITE1 and LOC348158 BINDING SITE2, designated SEQ ID:17028 and SEQ ID:9642 respectively, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26480] Another function of GAM175 is therefore inhibition of LOC348158 (Accession XP_300646.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348158.

[26481] LOC348370 (Accession XP_300721.1) is another GAM175 target gene, herein designated TARGET GENE. LOC348370 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348370, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348370 BINDING SITE, designated SEQ ID:11550, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26482] Another function of GAM175 is therefore inhibition of LOC348370 (Accession XP_300721.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348370.

[26483] LOC348378 (Accession XP_300723.1) is another GAM175 target gene, herein designated TARGET GENE. LOC348378 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348378, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348378 BINDING SITE, designated SEQ ID:15891, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26484] Another function of GAM175 is therefore inhibition of LOC348378 (Accession XP_300723.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC348378.

[26485] LOC348383 (Accession XP_300726.1) is another GAM175 target gene, herein designated TARGET GENE. LOC348383 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348383, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348383 BINDING SITE, designated SEQ ID:11550, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26486] Another function of GAM175 is therefore inhibition of LOC348383 (Accession XP_300726.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348383.

[26487] LOC351256 (Accession XP_301805.1) is another GAM175 target gene, herein designated TARGET GENE. LOC351256 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC351256, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC351256 BINDING SITE, designated SEQ ID:6773, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26488] Another function of GAM175 is therefore inhibition of LOC351256 (Accession XP_301805.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC351256.

[26489] LOC92078 (Accession XP_042684.1) is another GAM175 target gene, herein designated TARGET GENE. LOC92078 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC92078, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC92078 BINDING SITE, designated SEQ ID:4921, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26490] Another function of GAM175 is therefore inhibition of LOC92078 (Accession XP_042684.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC92078.

[26491] LOC96597 (Accession XP_039922.1) is another GAM175 target gene, herein designated TARGET GENE. LOC96597 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC96597, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC96597 BINDING SITE, designated SEQ ID:1106, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26492] Another function of GAM175 is therefore inhibition of LOC96597 (Accession XP_039922.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC96597.

[26493] LPHN2 (Accession NP_036434.1) is another GAM175 target gene, herein designated TARGET GENE. LPHN2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LPHN2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LPHN2

BINDING SITE, designated SEQ ID:9096, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26494] Another function of GAM175 is therefore inhibition of LPHN2 (Accession NP_036434.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPHN2.

[26495] MGC11242 (Accession NP_077296.1) is another GAM175 target gene, herein designated TARGET GENE. MGC11242 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC11242, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC11242 BINDING SITE, designated SEQ ID:8334, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26496] Another function of GAM175 is therefore inhibition of MGC11242 (Accession NP_077296.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11242.

[26497] MGC20785 (Accession NP_689934.1) is another GAM175

target gene, herein designated TARGET GENE. MGC20785 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC20785, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC20785 BINDING SITE, designated SEQ ID:14606, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26498] Another function of GAM175 is therefore inhibition of MGC20785 (Accession NP_689934.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20785.

[26499] MGC22014 (Accession XP_035307.1) is another GAM175 target gene, herein designated TARGET GENE. MGC22014 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC22014, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC22014 BINDING SITE, designated SEQ ID:6173, to the nucleotide sequence of GAM175 RNA, herein designated

GAM RNA, also designated SEQ ID:265.

[26500] Another function of GAM175 is therefore inhibition of MGC22014 (Accession XP_035307.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC22014.

[26501] MGC23908 (Accession XP_038290.2) is another GAM175 target gene, herein designated TARGET GENE. MGC23908 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC23908, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC23908 BINDING SITE, designated SEQ ID:2079, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26502] Another function of GAM175 is therefore inhibition of MGC23908 (Accession XP_038290.2) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC23908.

[26503] MGC2848 (Accession NP_116306.1) is another GAM175 target gene, herein designated TARGET GENE. MGC2848

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC2848, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC2848 BINDING SITE, designated SEQ ID:12200, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26504] Another function of GAM175 is therefore inhibition of MGC2848 (Accession NP_116306.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2848.

[26505] MGC33971 (Accession NP_699174.1) is another GAM175 target gene, herein designated TARGET GENE. MGC33971 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC33971, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC33971 BINDING SITE, designated SEQ ID:10456, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26506] Another function of GAM175 is therefore inhibition of MGC33971 (Accession NP_699174.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC33971.

[26507] MGC34728 (Accession NP_689746.1) is another GAM175 target gene, herein designated TARGET GENE. MGC34728 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC34728, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC34728 BINDING SITE, designated SEQ ID:14010, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26508] Another function of GAM175 is therefore inhibition of MGC34728 (Accession NP_689746.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC34728.

[26509] MGC39320 (Accession NP_689642.2) is another GAM175 target gene, herein designated TARGET GENE. MGC39320 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by MGC39320, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC39320 BINDING SITE, designated SEQ ID:18878, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26510] Another function of GAM175 is therefore inhibition of MGC39320 (Accession NP_689642.2) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC39320.

[26511] MGC40053 (Accession NP_689796.1) is another GAM175 target gene, herein designated TARGET GENE. MGC40053 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC40053, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC40053 BINDING SITE, designated SEQ ID:1339, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26512] Another function of GAM175 is therefore inhibition of

MGC40053 (Accession NP_689796.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC40053.

[26513] MGC4368 (Accession NP_078786.2) is another GAM175 target gene, herein designated TARGET GENE. MGC4368 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC4368, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC4368 BINDING SITE, designated SEQ ID:5575, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26514] Another function of GAM175 is therefore inhibition of MGC4368 (Accession NP_078786.2) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4368.

[26515] MIG-6 (Accession NP_061821.1) is another GAM175 target gene, herein designated TARGET GENE. MIG-6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MIG-6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MIG-6 BINDING SITE, designated SEQ ID:11440, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26516] Another function of GAM175 is therefore inhibition of MIG-6 (Accession NP_061821.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIG-6.

[26517] Mitochondrial ribosomal protein s12 (MRPS12, Accession NP_066930.1) is another GAM175 target gene, herein designated TARGET GENE. MRPS12 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MRPS12, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MRPS12 BINDING SITE, designated SEQ ID:18531, to the

nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26518] Another function of GAM175 is therefore inhibition of Mitochondrial ribosomal protein s12 (MRPS12, Accession NP_066930.1), a gene which is a component of the mitochondrial ribosome. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPS12.

[26519] The function of MRPS12 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM96.1.Mitochondrial ribosomal protein s12 (MRPS12, Accession NP_203527.1) is another GAM175 target gene, herein designated TARGET GENE. MRPS12 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MRPS12, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MRPS12 BINDING SITE, designated SEQ ID:18531, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26520] Another function of GAM175 is therefore inhibition of Mitochondrial ribosomal protein s12 (MRPS12, Accession NP_203527.1), a gene which is a component of the mitochondrial ribosome. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPS12.

[26521] The function of MRPS12 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM96.1.Mitochondrial ribosomal protein s12 (MRPS12, Accession NP_203526.1) is another GAM175 target gene, herein designated TARGET GENE. MRPS12 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MRPS12, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MRPS12 BINDING SITE, designated SEQ ID:18531, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26522] Another function of GAM175 is therefore inhibition of Mitochondrial ribosomal protein s12 (MRPS12, Accession

NP_203526.1), a gene which is a component of the mitochondrial ribosome. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPS12.

[26523] The function of MRPS12 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM96.1.MTA3 (Accession XP_038567.5) is another GAM175 target gene, herein designated TARGET GENE. MTA3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MTA3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MTA3 BINDING SITE, designated SEQ ID:5772, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26524] Another function of GAM175 is therefore inhibition of MTA3 (Accession XP_038567.5) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTA3.

[26525] MUM-1 (Accession XP_300238.1) is another GAM175 target gene, herein designated TARGET GENE. MUM-1 BIND-

ING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MUM-1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MUM-1 BINDING SITE, designated SEQ ID:17769, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26526] Another function of GAM175 is therefore inhibition of MUM-1 (Accession XP_300238.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MUM-1.

[26527] Max interacting protein 1 (MXI1, Accession NP_569157.1) is another GAM175 target gene, herein designated TARGET GENE. MXI1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MXI1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MXI1 BINDING SITE, designated SEQ ID:14939, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA,

also designated SEQ ID:265.

[26528] Another function of GAM175 is therefore inhibition of Max interacting protein 1 (MXI1, Accession NP_569157.1), a gene which acts as a tumor suppressor in vivo, engages the MYC network in a functionally relevant manner and therefore may be associated with Prostate cancer, neurofibrosarcoma. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of Prostate cancer, neurofibrosarcoma, and of other diseases and clinical conditions associated with MXI1.

[26529] The function of MXI1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM94.1.Max interacting protein 1 (MXI1, Accession NP_005953.2) is another GAM175 target gene, herein designated TARGET GENE. MXI1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MXI1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MXI1 BINDING SITE, designated SEQ ID:14939, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA,

also designated SEQ ID:265.

[26530] Another function of GAM175 is therefore inhibition of Max interacting protein 1 (MXI1, Accession NP_005953.2), a gene which acts as a tumor suppressor in vivo, engages the MYC network in a functionally relevant manner and therefore may be associated with Prostate cancer, neurofibrosarcoma. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of Prostate cancer, neurofibrosarcoma, and of other diseases and clinical conditions associated with MXI1.

[26531] The function of MXI1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM94.1.N4BP3 (Accession XP_038920.2) is another GAM175 target gene, herein designated TARGET GENE. N4BP3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by N4BP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of N4BP3 BINDING SITE, designated SEQ ID:18724, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26532] Another function of GAM175 is therefore inhibition of N4BP3 (Accession XP_038920.2) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with N4BP3.

[26533] Nucleosome assembly protein 1-like 1 (NAP1L1, Accession NP_631946.1) is another GAM175 target gene, herein designated TARGET GENE. NAP1L1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by NAP1L1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NAP1L1 BINDING SITE, designated SEQ ID:12445, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26534] Another function of GAM175 is therefore inhibition of Nucleosome assembly protein 1-like 1 (NAP1L1, Accession NP_631946.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAP1L1.

[26535] Nucleosome assembly protein 1-like 1 (NAP1L1, Accession NP_004528.1) is another GAM175 target gene, herein designated TARGET GENE. NAP1L1 BINDING SITE is a tar-

get binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by NAP1L1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NAP1L1 BINDING SITE, designated SEQ ID:12445, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26536] Another function of GAM175 is therefore inhibition of Nucleosome assembly protein 1-like 1 (NAP1L1, Accession NP_004528.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAP1L1.

[26537] NCE2 (Accession NP_057594.2) is another GAM175 target gene, herein designated TARGET GENE. NCE2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by NCE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NCE2 BINDING SITE, designated SEQ ID:5057, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26538] Another function of GAM175 is therefore inhibition of NCE2 (Accession NP_057594.2) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCE2.

[26539] N-myc downstream regulated gene 1 (NDRG1, Accession NP_006087.1) is another GAM175 target gene, herein designated TARGET GENE. NDRG1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NDRG1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NDRG1 BINDING SITE, designated SEQ ID:5659, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26540] Another function of GAM175 is therefore inhibition of N-myc downstream regulated gene 1 (NDRG1, Accession NP_006087.1), a gene which may have a growth inhibitory role. and therefore may be associated with Hereditary motor and sensory neuropathy, lom type. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of Hereditary motor and sensory neuropathy, lom type, and of other diseases and clinical conditions associated with NDRG1.

[26541] The function of NDRG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.NUPL1 (Accession NP_055593.1) is another GAM175 target gene, herein designated TARGET GENE. NUPL1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by NUPL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NUPL1 BINDING SITE, designated SEQ ID:14772, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26542] Another function of GAM175 is therefore inhibition of NUPL1 (Accession NP_055593.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUPL1.

[26543] NUPL1 (Accession NP_054808.1) is another GAM175 target gene, herein designated TARGET GENE. NUPL1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by NUPL1, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NUPL1 BINDING SITE, designated SEQ ID:14772, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26544] Another function of GAM175 is therefore inhibition of NUPL1 (Accession NP_054808.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUPL1.

[26545] Nuclear transport factor 2-like export factor 2 (NXT2, Accession NP_061168.2) is another GAM175 target gene, herein designated TARGET GENE. NXT2 BINDING SITE1 and NXT2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by NXT2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NXT2 BINDING SITE1 and NXT2 BINDING SITE2, designated SEQ ID:9223 and SEQ ID:5917 respectively, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26546] Another function of GAM175 is therefore inhibition of Nu-

clear transport factor 2-like export factor 2 (NXT2, Accession NP_061168.2) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXT2.

[26547] Pas domain containing serine/threonine kinase (PASK, Accession NP_055963.1) is another GAM175 target gene, herein designated TARGET GENE. PASK BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PASK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PASK BINDING SITE, designated SEQ ID:7891, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26548] Another function of GAM175 is therefore inhibition of Pas domain containing serine/threonine kinase (PASK, Accession NP_055963.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PASK.

[26549] Phosphodiesterase 11a (PDE11A, Accession NP_058649.2) is another GAM175 target gene, herein designated TARGET GENE. PDE11A BINDING SITE is a target binding site

found in the 3` untranslated region of mRNA encoded by PDE11A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDE11A BINDING SITE, designated SEQ ID:16840, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26550] Another function of GAM175 is therefore inhibition of Phosphodiesterase 11a (PDE11A, Accession NP_058649.2) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE11A.

[26551] Period homolog 3 (drosophila) (PER3, Accession NP_058515.1) is another GAM175 target gene, herein designated TARGET GENE. PER3 BINDING SITE1 and PER3 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by PER3, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PER3 BINDING SITE1 and PER3 BINDING SITE2, designated SEQ ID:2006 and SEQ ID:3046 respectively, to the nucleotide sequence

of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26552] Another function of GAM175 is therefore inhibition of Period homolog 3 (drosophila) (PER3, Accession NP_058515.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PER3.

[26553] Phospholipase a2, group iii (PLA2G3, Accession NP_056530.1) is another GAM175 target gene, herein designated TARGET GENE. PLA2G3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PLA2G3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PLA2G3 BINDING SITE, designated SEQ ID:14052, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26554] Another function of GAM175 is therefore inhibition of Phospholipase a2, group iii (PLA2G3, Accession NP_056530.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLA2G3.

[26555] Paired mesoderm homeo box 1 (PMX1, Accession NP_073207.1) is another GAM175 target gene, herein designated TARGET GENE. PMX1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PMX1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PMX1 BINDING SITE, designated SEQ ID:10080, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26556] Another function of GAM175 is therefore inhibition of Paired mesoderm homeo box 1 (PMX1, Accession NP_073207.1), a gene which acts as a transcriptional regulator of muscle creatine kinase. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMX1.

[26557] The function of PMX1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM96.1.Paired mesoderm homeo box 1 (PMX1, Accession NP_008833.1) is another GAM175 target gene, herein designated TARGET GENE. PMX1 BINDING SITE is a

target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PMX1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PMX1 BINDING SITE, designated SEQ ID:10080, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26558] Another function of GAM175 is therefore inhibition of Paired mesoderm homeo box 1 (PMX1, Accession NP_008833.1), a gene which acts as a transcriptional regulator of muscle creatine kinase. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMX1.

[26559] The function of PMX1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM96.1.Polymerase (dna directed), eta (POLH, Accession NP_006493.1) is another GAM175 target gene, herein designated TARGET GENE. POLH BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by POLH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of POLH BINDING SITE, designated SEQ ID:9909, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26560] Another function of GAM175 is therefore inhibition of Polymerase (dna directed), eta (POLH, Accession NP_006493.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLH.

[26561] Ppar binding protein (PPARBP, Accession NP_004765.2) is another GAM175 target gene, herein designated TARGET GENE. PPARBP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PPARBP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPARBP BINDING SITE, designated SEQ ID:18113, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26562] Another function of GAM175 is therefore inhibition of Ppar binding protein (PPARBP, Accession NP_004765.2), a gene which interacts with thyroid hormone receptors to

regulate nuclear receptor- mediated transcription; binds dna and p53 protein. and therefore may be associated with Breast cancer. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of Breast cancer, and of other diseases and clinical conditions associated with PPARBP.

[26563] The function of PPARBP has been established by previous studies. By immunoscreening a human B- lymphoma cell cDNA expression library with the anti- p53 (see OMIM Ref. No. TP53; 191170) monoclonal antibody PAb1801, Drane et al. (1997) identified PPARBP, which they called RB18A for 'recognized by PAb1801 monoclonal antibody.' The predicted 1,566- amino acid RB18A protein contains several potential nuclear localization signals, 13 potential N-glycosylation sites, and a high number of potential phosphorylation sites. Despite sharing common antigenic determinants with p53, RB18A does not show significant nucleotide or amino acid sequence similarity with p53. Whereas the calculated molecular mass of RB18A is 166 kD, the apparent mass of recombinant RB18A was 205 kD by SDS- PAGE analysis. Drane et al. (1997) demonstrated that RB18A shares functional properties with p53, including DNA binding, p53 binding, and self- oligomerization.

Furthermore, RB18A was able to activate the sequence-specific binding of p53 to DNA, which was induced through an unstable interaction between both proteins. Northern blot analysis of human tissues detected an 8.5-kb RB18A transcript in all tissues examined except kidney, with highest expression in heart.

[26564] Animal model experiments lend further support to the function of PPARBP. Ito et al. (2000) generated mouse mutants with targeted disruption of the Trap220 gene. The null mutants died during an early gestational stage with heart failure and exhibited impaired neuronal development with extensive apoptosis. Primary embryonic fibroblasts derived from null mutants showed impaired cell cycle regulation and a prominent decrease of thyroid hormone receptor (see OMIM Ref. No. 190160) function that was restored by ectopic Trap220; no defect in activation by Gal4- RARA, Gal4- RXRA, p53, or Gal4- VP16 (see OMIM Ref. No. 300019) was detected. Haploinsufficient mice showed growth retardation, pituitary hypothyroidism, and widely impaired transcription in certain organs. The results indicated that TRAP220 is essential for a wide range of physiologic processes and that it also has gene- and activator- selective functions.

[26565] It is appreciated that the abovementioned animal model for PPARBP is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[26566] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26567] Drane, P.; Barel, M.; Balbo, M.; Frade, R. : Identification of RB18A, a 205 kDa new p53 regulatory protein which shares antigenic and functional properties with p53. Oncogene 15: 3013- 3024, 1997. ; and

[26568] Ito, M.; Yuan, C.- X.; Okano, H. J.; Darnell, R. B.; Roeder, R. G. : Involvement of the TRAP220 component of the TRAP/SMCC coactivator complex in embryonic development and thyroid hormone.

[26569] Further studies establishing the function and utilities of PPARBP are found in John Hopkins OMIM database record ID 604311, and in cited publications listed in Table 5, which are hereby incorporated by reference.Peptidylprolyl isomerase (cyclophilin)-like 2 (PPIL2, Accession NP_055152.1) is another GAM175 target gene, herein designated TARGET GENE. PPIL2 BINDING SITE is a target binding site found in the 3` untranslated region of multi-

ple transcripts of mRNA encoded by PPIL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPIL2 BINDING SITE, designated SEQ ID:19201, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26570] Another function of GAM175 is therefore inhibition of Peptidylprolyl isomerase (cyclophilin)-like 2 (PPIL2, Accession NP_055152.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPIL2.

[26571] Phosphatase and tensin homolog (mutated in multiple advanced cancers 1) (PTEN, Accession NP_000305.1) is another GAM175 target gene, herein designated TARGET GENE. PTEN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PTEN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTEN BINDING SITE, designated SEQ ID:17273, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26572] Another function of GAM175 is therefore inhibition of Phosphatase and tensin homolog (mutated in multiple advanced cancers 1) (PTEN, Accession NP_000305.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTEN.

[26573] Prostaglandin e synthase 2 (PTGES2, Accession NP_079348.1) is another GAM175 target gene, herein designated TARGET GENE. PTGES2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PTGES2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTGES2 BINDING SITE, designated SEQ ID:10220, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26574] Another function of GAM175 is therefore inhibition of Prostaglandin e synthase 2 (PTGES2, Accession NP_079348.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGES2.

[26575] RAB11-FIP4 (Accession NP_116321.2) is another GAM175

target gene, herein designated TARGET GENE. RAB11-FIP4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAB11-FIP4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAB11-FIP4 BINDING SITE, designated SEQ ID:12040, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26576] Another function of GAM175 is therefore inhibition of RAB11-FIP4 (Accession NP_116321.2) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB11-FIP4.

[26577] Retinoic acid induced 17 (RAI17, Accession NP_065071.1) is another GAM175 target gene, herein designated TARGET GENE. RAI17 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RAI17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAI17 BINDING SITE, designated SEQ ID:9293, to the nucleotide sequence

of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26578] Another function of GAM175 is therefore inhibition of Retinoic acid induced 17 (RAI17, Accession NP_065071.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI17.

[26579] Ribonuclease, rnase a family, k6 (RNASE6, Accession NP_005606.1) is another GAM175 target gene, herein designated TARGET GENE. RNASE6 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by RNASE6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RNASE6 BINDING SITE, designated SEQ ID:15669, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26580] Another function of GAM175 is therefore inhibition of Ribonuclease, rnase a family, k6 (RNASE6, Accession NP_005606.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNASE6.

[26581] Ribosomal protein s6 kinase, 90kda, polypeptide 2 (RPS6KA2, Accession NP_066958.2) is another GAM175 target gene, herein designated TARGET GENE. RPS6KA2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RPS6KA2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RPS6KA2 BINDING SITE, designated SEQ ID:4835, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26582] Another function of GAM175 is therefore inhibition of Ribosomal protein s6 kinase, 90kda, polypeptide 2 (RPS6KA2, Accession NP_066958.2), a gene which phosphorylates a wide range of substrates including ribosomal protein s6. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPS6KA2.

[26583] The function of RPS6KA2 has been established by previous studies. Serine/threonine protein kinases in the ribosomal S6 kinase (RSK) family have been implicated as signaling intermediates in the cellular response to several growth factors. Moller et al. (1994) described the cloning and

characterization of 3 genes encoding 3 isoforms of ribosomal protein S6 kinase, which they called HU1 (RPS6KA1; 601684), HU2 (RPS6KA2), and HU3 (RPS6KA3; 300075). The partial HU2 cDNA (GenBank L07598) encodes a predicted protein containing 2 distinct consensus ATP- binding site sequences. Northern blot and RNase protection analyses detected major 7.5- kb and minor 3.5- kb HU2 transcripts in fibroblasts, skeletal muscle, lymphocytes, and placenta. Zhao et al. (1995) cloned a full- length cDNA encoding the RPS6KA2 isoform of ribosomal protein S6 kinase, which they designated RSK3. The deduced 733- amino acid RSK3 protein has 84% and 75% sequence identity with RSK2 (RPS6KA3) and RSK1 (RPS6KA1), respectively. RSK3 has a unique N- terminal sequence which contains a putative bipartite nuclear localization signal. Immunoblot analysis of human cell lysates detected an 83- kD RSK protein. The authors demonstrated serum-stimulated nuclear translocation of endogenous RSK3 in HeLa cells. RSK3 exhibited growth- stimulated autophosphorylation and kinase activity; however, its relative activity toward several known RSK substrates differed from the activities of other RSKs. Unlike RSK1, RSK3 was not activated by ERK2 (PRKM1; 176948) in vitro. Northern blot

analysis detected a single 6.5- kb RSK3 transcript in all tissues examined, with the highest expression in lung and skeletal muscle.

[26584]

[26585] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26586] Moller, D. E.; Xia, C. H.; Tang, W.; Zhu, A. X.; Jakubowski, M. : Human rsk isoforms: cloning and characterization of tissue- specific expression. Am. J. Physiol. 266: C351-C359, 1994. ; and

[26587] Zhao, Y.; Bjorbaek, C.; Weremowicz, S.; Morton, C. C.; Moller, D. E. : RSK3 encodes a novel pp90rsk isoform with a unique N- terminal sequence: growth factor- stimulated kinase function and n.

[26588] Further studies establishing the function and utilities of RPS6KA2 are found in John Hopkins OMIM database record ID 601685, and in cited publications listed in Table 5, which are hereby incorporated by refer-ence.Stearoyl-coa desaturase (delta-9-desaturase) (SCD, Accession NP_005054.2) is another GAM175 target gene, herein designated TARGET GENE. SCD BINDING SITE is a target binding site found in the 3` untranslated region of

mRNA encoded by SCD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SCD BINDING SITE, designated SEQ ID:15911, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26589] Another function of GAM175 is therefore inhibition of Stearoyl-coa desaturase (delta-9-desaturase) (SCD, Accession NP_005054.2), a gene which functions in the synthesis of unsaturated fatty acids. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCD.

[26590] The function of SCD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM144.1.Sidekick homolog 1 (chicken) (SDK1, Accession NP_689957.1) is another GAM175 target gene, herein designated TARGET GENE. SDK1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SDK1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of SDK1 BINDING SITE, designated SEQ ID:6489, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26591] Another function of GAM175 is therefore inhibition of Sidekick homolog 1 (chicken) (SDK1, Accession NP_689957.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDK1.

[26592] SEI1 (Accession NP_037508.1) is another GAM175 target gene, herein designated TARGET GENE. SEI1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SEI1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SEI1 BINDING SITE, designated SEQ ID:3289, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26593] Another function of GAM175 is therefore inhibition of SEI1 (Accession NP_037508.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEI1.

[26594] Selenoprotein n, 1 (SEPN1, Accession NP_065184.1) is an-

other GAM175 target gene, herein designated TARGET GENE. SEPN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SEPN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SEPN1 BINDING SITE, designated SEQ ID:12396, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26595] Another function of GAM175 is therefore inhibition of Selenoprotein n, 1 (SEPN1, Accession NP_065184.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEPN1.

[26596] SERP1 (Accession NP_055260.1) is another GAM175 target gene, herein designated TARGET GENE. SERP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SERP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SERP1 BINDING SITE, designated SEQ ID:14919, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA,

also designated SEQ ID:265.

[26597] Another function of GAM175 is therefore inhibition of SERP1 (Accession NP_055260.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERP1.

[26598] Sh3 domain binding glutamic acid-rich protein like 3 (SH3BGRL3, Accession NP_112576.1) is another GAM175 target gene, herein designated TARGET GENE. SH3BGRL3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SH3BGRL3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SH3BGRL3 BINDING SITE, designated SEQ ID:9406, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26599] Another function of GAM175 is therefore inhibition of Sh3 domain binding glutamic acid-rich protein like 3 (SH3BGRL3, Accession NP_112576.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BGRL3.

[26600] Sh3 and multiple ankyrin repeat domains 3 (SHANK3, Ac-

cession XP_037493.1) is another GAM175 target gene, herein designated TARGET GENE. SHANK3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SHANK3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SHANK3 BINDING SITE, designated SEQ ID:2299, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26601] Another function of GAM175 is therefore inhibition of Sh3 and multiple ankyrin repeat domains 3 (SHANK3, Accession XP_037493.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHANK3.

[26602] Solute carrier family 11 (proton-coupled divalent metal ion transporters), member 2 (SLC11A2, Accession NP_000608.1) is another GAM175 target gene, herein designated TARGET GENE. SLC11A2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC11A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of SLC11A2 BINDING SITE, designated SEQ ID:17770, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26603] Another function of GAM175 is therefore inhibition of Solute carrier family 11 (proton-coupled divalent metal ion transporters), member 2 (SLC11A2, Accession NP_000608.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC11A2.

[26604] Solute carrier family 16 (monocarboxylic acid transporters), member 6 (SLC16A6, Accession NP_004685.1) is another GAM175 target gene, herein designated TARGET GENE. SLC16A6 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SLC16A6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC16A6 BINDING SITE, designated SEQ ID:12166, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26605] Another function of GAM175 is therefore inhibition of So-

lute carrier family 16 (monocarboxylic acid transporters), member 6 (SLC16A6, Accession NP_004685.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC16A6.

[26606] Solute carrier family 1 (glutamate/neutral amino acid transporter), member 4 (SLC1A4, Accession NP_003029.2) is another GAM175 target gene, herein designated TARGET GENE. SLC1A4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC1A4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC1A4 BINDING SITE, designated SEQ ID:15625, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26607] Another function of GAM175 is therefore inhibition of Solute carrier family 1 (glutamate/neutral amino acid transporter), member 4 (SLC1A4, Accession NP_003029.2), a gene which transports alanine, serine, cysteine, and threonine. exhibits sodium dependence. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with SLC1A4.

[26608] The function of SLC1A4 has been established by previous studies. In a screening for cDNAs encoding proteins similar to the sodium- coupled glutamate transporter GLAST1, Hofmann et al. (1994) isolated a cDNA clone encoding a protein that turned out to be identical to the neutral amino acid transporter ASCT1 (Arriza et al., 1993; Shafqat et al., 1993). The new member of the GLAST- related transporter family did not transport glutamate or aspartate but alanine, serine, cysteine, and threonine instead. The open reading frame of 1,572 basepairs encodes 524 amino acid residues distributed over 8 exons spanning at least 40 kb of genomic DNA. The gene for ASCT1, designated SLC1A4, was assigned to 2p15- p13 by fluorescence in situ hybridization. The gene structure was not related to any previously characterized transporter gene. Zerangue and Kavanaugh (1996) found that the ASCT1 transporter functions primarily as an amino acid exchanger. Transport is associated with a chloride channel activity that is thermodynamically uncoupled from amino acid transport.

[26609]

[26610] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26611] Arriza, J. L.; Kavanaugh, M. P.; Fairman, W. A.; Wu, Y.- N.; Murdoch, G. H.; North, R. A.; Amara, S. G. : Cloning and expression of a human neutral amino acid transporter with structural similarity to the glutamate transporter gene family. J. Biol. Chem. 268: 15329- 15332, 1993. ; and

[26612] Zerangue, N.; Kavanaugh, M. P. : ASCT- 1 is a neutral amino acid exchanger with chloride channel activity. J. Biol. Chem. 271: 27991- 27994, 1996.

[26613] Further studies establishing the function and utilities of SLC1A4 are found in John Hopkins OMIM database record ID 600229, and in cited publications listed in Table 5, which are hereby incorporated by reference.Solute carrier family 39 (zinc transporter), member 1 (SLC39A1, Accession NP_055252.2) is another GAM175 target gene, herein designated TARGET GENE. SLC39A1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SLC39A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of SLC39A1 BINDING SITE, designated SEQ ID:12020, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26614] Another function of GAM175 is therefore inhibition of Solute carrier family 39 (zinc transporter), member 1 (SLC39A1, Accession NP_055252.2), a gene which is a divalent (zinc/iron) metal ion transporter. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC39A1.

[26615] The function of SLC39A1 has been established by previous studies. The ZRT- and IRT- related protein (ZIP) family is composed of divalent metal ion transporters, including A. thaliana IRT1 (iron- regulated transporter- 1), which appears to play a role in iron uptake, and S. cerevisiae ZRT1 (zinc- regulated transporter- 1) and ZRT2, and A. thaliana ZIP1 to ZIP4, all of which are probably zinc transporters (reviewed by Eng et al., 1998). The human growth arrest- inducible gene product (GAIP) is also a ZIP family member based on sequence similarity. Lioumi et al. (1998) generated a transcript map of the region within and in the proximity of the epidermal differentiation com-

plex (EDC; 601588), which is located in 1q21. They identified a partial ZIRTL cDNA as mapping to the distal end of the EDC, 200 kb from the S100A1 gene (OMIM Ref. No. 176940). Lioumi et al. (1998) found that a portion of the ZIRTL cDNA encodes a polypeptide with significant sequence similarity to the ZIP family of iron and zinc transporters from plants and yeast. By screening a human keratinocyte cDNA library with the partial ZIRTL cDNA, Lioumi et al. (1999) isolated a full- length ZIRTL cDNA. The predicted 324- amino acid ZIRTL protein contains 8 transmembrane domains, 9 possible N- myristylation sites, a potential protein kinase C phosphorylation site, and 4 potential protein kinase II phosphorylation sites. Human ZIRTL shares 21 to 22% amino acid sequence identity with A. thaliana IRT1 and ZIP1 to ZIP4, Pisum sativum Rit1, and S. cerevisiae ZRT1 and ZRT2. ZIRTL also shares 34% amino acid sequence identity with GAIP. The human and mouse Zirtl proteins are 90% similar. The ZIRTL gene contains 4 exons. Northern blot analysis detected a 2.1- kb ZIRTL transcript in all human tissues tested, namely adult heart, lung, brain, liver, pancreas, small intestine, colon, kidney, spleen, thymus, peripheral blood leukocytes, skeletal muscle, testis, ovary, placenta, prostate, and ker-

atinocytes, and fetal heart, kidney, small intestine, and skin. In situ hybridization showed that mouse Zirtl is developmentally regulated in the skin, where it was expressed in the epidermal layer, excluding the dermis, at E17.5, but not in embryonic days 10.5 and 15.5 or P21. In the small intestine, Zirtl was found toward the base of the intestinal villi from E17.5. In the pancreas, Zirtl expression was found from E17.5. Zirtl expression was not detected in the liver. Zirtl was expressed in osteoblasts of developing bone from E15.5 and in ameloblasts and odontoblasts at late stages of tooth development at P21. Moderate expression of Zirtl was observed in brain in the hippocampus

[26616]

[26617] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26618] Lioumi, M.; Ferguson, C. A.; Sharpe, P. T.; Freeman, T.; Marenholz, I.; Mischke, D.; Heizmann, C.; Ragoussis, J. : Isolation and characterization of human and mouse ZIRTL, a member of the IRT1 family of transporters, mapping within the epidermal differentiation complex. [26619] Lioumi, M.; Olavesen, M. G.; Nizetic, D.; Ragoussis, J. : High- resolution YAC fragmentation map of 1q21. Genomics 49: 200- 208, 1998.

[26620] Further studies establishing the function and utilities of SLC39A1 are found in John Hopkins OMIM database record ID 604740, and in cited publications listed in Table 5, which are hereby incorporated by reference.SMURF1 (Accession XP_166483.1) is another GAM175 target gene, herein designated TARGET GENE. SMURF1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by SMURF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SMURF1 BINDING SITE, designated SEQ ID:17695, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26621] Another function of GAM175 is therefore inhibition of SMURF1 (Accession XP_166483.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMURF1.

[26622] SMURF1 (Accession NP_065162.1) is another GAM175 tar-

get gene, herein designated TARGET GENE. SMURF1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by SMURF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SMURF1 BINDING SITE, designated SEQ ID:17695, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26623] Another function of GAM175 is therefore inhibition of SMURF1 (Accession NP_065162.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMURF1.

[26624] SMURF1 (Accession NP_851994.1) is another GAM175 target gene, herein designated TARGET GENE. SMURF1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by SMURF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SMURF1 BINDING SITE, designated

SEQ ID:17695, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26625] Another function of GAM175 is therefore inhibition of SMURF1 (Accession NP_851994.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMURF1.

[26626] Sry (sex determining region y)-box 13 (SOX13, Accession NP_005677.1) is another GAM175 target gene, herein designated TARGET GENE. SOX13 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SOX13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SOX13 BINDING SITE, designated SEQ ID:17045, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26627] Another function of GAM175 is therefore inhibition of Sry (sex determining region y)-box 13 (SOX13, Accession NP_005677.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with SOX13.

[26628] Serine racemase (SRR, Accession NP_068766.1) is another GAM175 target gene, herein designated TARGET GENE. SRR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SRR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SRR BINDING SITE, designated SEQ ID:14627, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26629] Another function of GAM175 is therefore inhibition of Serine racemase (SRR, Accession NP_068766.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRR.

[26630] Suppression of tumorigenicity 7 like (ST7L, Accession NP_620056.1) is another GAM175 target gene, herein designated TARGET GENE. ST7L BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ST7L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the

complementarity of the nucleotide sequences of ST7L BINDING SITE, designated SEQ ID:19906, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26631] Another function of GAM175 is therefore inhibition of Suppression of tumorigenicity 7 like (ST7L, Accession NP_620056.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ST7L.

[26632] Suppression of tumorigenicity 7 like (ST7L, Accession NP_620055.1) is another GAM175 target gene, herein designated TARGET GENE. ST7L BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ST7L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ST7L BINDING SITE, designated SEQ ID:19906, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26633] Another function of GAM175 is therefore inhibition of Suppression of tumorigenicity 7 like (ST7L, Accession NP_620055.1) . Accordingly, utilities of GAM175 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with ST7L.

[26634] Suppression of tumorigenicity 7 like (ST7L, Accession NP_060214.2) is another GAM175 target gene, herein designated TARGET GENE. ST7L BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ST7L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ST7L BINDING SITE, designated SEQ ID:19906, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26635] Another function of GAM175 is therefore inhibition of Suppression of tumorigenicity 7 like (ST7L, Accession NP_060214.2) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ST7L.

[26636] Thrombomodulin (THBD, Accession NP_000352.1) is another GAM175 target gene, herein designated TARGET GENE. THBD BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by THBD, corresponding to a target binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of THBD BINDING SITE, designated SEQ ID:6439, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26637] Another function of GAM175 is therefore inhibition of Thrombomodulin (THBD, Accession NP_000352.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THBD.

[26638] Thy-1 cell surface antigen (THY1, Accession NP_006279.2) is another GAM175 target gene, herein designated TARGET GENE. THY1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by THY1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of THY1 BINDING SITE, designated SEQ ID:15926, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26639] Another function of GAM175 is therefore inhibition of Thy-1 cell surface antigen (THY1, Accession

NP_006279.2), a gene which plays a role in cell- cell or cell- ligand interactions during synaptogenesis. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THY1.

[26640] The function of THY1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM74.1.Transmembrane protease, serine 2 (TMPRSS2, Accession NP_005647.2) is another GAM175 target gene, herein designated TARGET GENE. TMPRSS2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TMPRSS2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TMPRSS2 BINDING SITE, designated SEQ ID:3601, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26641] Another function of GAM175 is therefore inhibition of Transmembrane protease, serine 2 (TMPRSS2, Accession NP_005647.2) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with TMPRSS2.

[26642] TU12B1-TY (Accession NP_057659.1) is another GAM175 target gene, herein designated TARGET GENE. TU12B1-TY BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TU12B1-TY, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TU12B1-TY BINDING SITE, designated SEQ ID:9561, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26643] Another function of GAM175 is therefore inhibition of TU12B1-TY (Accession NP_057659.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TU12B1-TY.

[26644] TULP4 (Accession NP_064630.1) is another GAM175 target gene, herein designated TARGET GENE. TULP4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TULP4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TULP4

BINDING SITE, designated SEQ ID:10089, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26645] Another function of GAM175 is therefore inhibition of TULP4 (Accession NP_064630.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TULP4.

[26646] UMP-CMPK (Accession NP_057392.1) is another GAM175 target gene, herein designated TARGET GENE. UMP-CMPK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by UMP-CMPK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UMP-CMPK BINDING SITE, designated SEQ ID:5399, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26647] Another function of GAM175 is therefore inhibition of UMP-CMPK (Accession NP_057392.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UMP-CMPK.

[26648] Unc-84 homolog a (c. elegans) (UNC84B, Accession

XP_039332.1) is another GAM175 target gene, herein designated TARGET GENE. UNC84B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by UNC84B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UNC84B BINDING SITE, designated SEQ ID:8301, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26649] Another function of GAM175 is therefore inhibition of Unc-84 homolog a (c. elegans) (UNC84B, Accession XP_039332.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UNC84B.

[26650] Unc-84 homolog a (c. elegans) (UNC84B, Accession NP_056189.1) is another GAM175 target gene, herein designated TARGET GENE. UNC84B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by UNC84B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

UNC84B BINDING SITE, designated SEQ ID:8301, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26651] Another function of GAM175 is therefore inhibition of Unc-84 homolog a (c. elegans) (UNC84B, Accession NP_056189.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UNC84B.

[26652] Ubiquitin specific protease 25 (USP25, Accession NP_037528.2) is another GAM175 target gene, herein designated TARGET GENE. USP25 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by USP25, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of USP25 BINDING SITE, designated SEQ ID:3776, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26653] Another function of GAM175 is therefore inhibition of Ubiquitin specific protease 25 (USP25, Accession NP_037528.2) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP25.

[26654] Zinc finger protein 313 (ZNF313, Accession NP_061153.1) is another GAM175 target gene, herein designated TARGET GENE. ZNF313 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF313, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF313 BINDING SITE, designated SEQ ID:1924, to the nucleotide sequence of GAM175 RNA, herein designated GAM RNA, also designated SEQ ID:265.

[26655] Another function of GAM175 is therefore inhibition of Zinc finger protein 313 (ZNF313, Accession NP_061153.1) . Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF313.

[26656]

[26657] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 176 (GAM176), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26658] GAM176 is a novel bioinformatically detected regulatory,

non protein coding, micro RNA (miRNA) gene. The method by which GAM176 was detected is described hereinabove with reference to Figs. 8-15.

[26659] GAM176 gene, herein designated GAM GENE, and GAM176 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[26660] GAM176 gene encodes a GAM176 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM176 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM176 precursor RNA is designated SEQ ID:73, and is provided hereinbelow with reference to the sequence listing part.

[26661] GAM176 precursor RNA folds onto itself, forming GAM176 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26662] GAM176 precursor RNA folds onto itself, forming GAM176 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[26663] Nucleotide sequence of GAM176 precursor RNA, designated SEQ-ID: 73, and a schematic representation of a predicted secondary folding of GAM176 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[26664] An enzyme complex designated DICER COMPLEX, `dices` the GAM176 folded precursor RNA into GAM176 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM176 RNA is desig-

nated SEQ ID:345, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[26665] GAM176 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM176 target RNA, herein designated GAM TARGET RNA. GAM176 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[26666] GAM176 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM176 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM176 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM176 RNA may have a different number of target

binding sites in untranslated regions of a GAM176 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26667] The complementary binding of GAM176 RNA, herein designated GAM RNA, to target binding sites on GAM176 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM176 target RNA into GAM176 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26668] It is appreciated that GAM176 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM176 target genes. The mRNA of each one of this plurality of GAM176 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM176 RNA, herein designated GAM RNA, and which when bound by GAM176 RNA causes inhibition of translation of respective one or more GAM176 target proteins.

[26669] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM176 gene, herein designated GAM GENE, on one or more GAM176 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26670] It is appreciated that specific functions and accordingly utilities of GAM176 correlate with, and may be deduced from, the identity of the target genes which GAM176 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26671]

[26672]

[26673] V-myb myeloblastosis viral oncogene homolog (avian)-like 1 (MYBL1, Accession XM_034274.10) is a GAM176 target gene, herein designated TARGET GENE. MYBL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MYBL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MYBL1 BINDING SITE, designated SEQ ID:18625, to the nucleotide sequence of GAM176 RNA, herein designated GAM RNA, also designated SEQ ID:345.

[26674] A function of GAM176 is therefore inhibition of V-myb myeloblastosis viral oncogene homolog (avian)-like 1 (MYBL1, Accession XM_034274.10), a gene which could have a role in the proliferation and/or differentiation of neurogenic, spermatogenic and b- lymphoid cells. Accordingly, utilities of GAM176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYBL1.

[26675] The function of MYBL1 has been established by previous studies. Nomura et al. (1988) isolated and characterized cDNA clones for 2 human MYB- related genes, AMYB and BMYB (OMIM Ref. No. 601415). Using probes in Southern

blot analysis of rodent- human hybrid DNAs, Barletta et al. (1991) localized the MYBL1 locus to 8cen- q22 and refined the localization to 8q22- q23 by in situ hybridization. Takahashi et al. (1995) found that MYBL1 mRNA is expressed mainly in testis and peripheral blood leukocytes. AMYB could activate transcription from the promoter- containing MYB- binding sites in all cells examined. In addition to the 2 domains (a DNA- binding domain and a transcriptional activation domain), 2 negative regulatory domains were identified in the MYBL1 gene. These results indicated that the gene functions as a transcriptional activator and that the regulatory mechanism of gene activity is similar to that of the MYB (OMIM Ref. No. 189990) gene.

[26676]

[26677] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26678] Nomura, N.; Takahashi, M.; Matsui, M.; Ishii, S.; Date, T.; Sasamoto, S.; Ishizaki, R. : Isolation of human cDNA clones of MYB- related genes, A- MYB and B- MYB. Nucleic Acids Res. 16: 11075- 11089, 1988. ; and

[26679] Takahashi, T.; Nakagoshi, H.; Sarai, A.; Nomura, N.; Ya-

mamoto, T.; Ishii, S. : Human A- myb gene encodes a transcriptional activator containing the negative regulatory domains. FEBS Lett.

[26680] Further studies establishing the function and utilities of MYBL1 are found in John Hopkins OMIM database record ID 159405, and in cited publications listed in Table 5, which are hereby incorporated by reference.

[26681] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 177 (GAM177), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26682] GAM177 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM177 was detected is described hereinabove with reference to Figs. 8-15.

[26683] GAM177 gene, herein designated GAM GENE, and GAM177 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[26684] GAM177 gene encodes a GAM177 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM177 precur-

sor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM177 precursor RNA is designated SEQ ID:133, and is provided hereinbelow with reference to the sequence listing part.

[26685] GAM177 precursor RNA folds onto itself, forming GAM177 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26686] GAM177 precursor RNA folds onto itself, forming GAM177 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[26687] Nucleotide sequence of GAM177 precursor RNA, designated SEQ-ID: 133, and a schematic representation of a predicted secondary folding of GAM177 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[26688] An enzyme complex designated DICER COMPLEX, `dices` the GAM177 folded precursor RNA into GAM177 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM177 RNA is designated SEQ ID:385, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[26689] GAM177 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM177 target RNA, herein designated GAM TARGET RNA. GAM177 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[26690] GAM177 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM177 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM177 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM177 RNA may have a different number of target binding sites in untranslated regions of a GAM177 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26691] The complementary binding of GAM177 RNA, herein designated GAM RNA, to target binding sites on GAM177 target RNA, herein designated GAM TARGET RNA, such as

BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM177 target RNA into GAM177 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26692] It is appreciated that GAM177 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM177 target genes. The mRNA of each one of this plurality of GAM177 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM177 RNA, herein designated GAM RNA, and which when bound by GAM177 RNA causes inhibition of translation of respective one or more GAM177 target proteins.

[26693] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM177 gene, herein designated GAM GENE, on one or more GAM177 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other

recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26694] It is appreciated that specific functions and accordingly utilities of GAM177 correlate with, and may be deduced from, the identity of the target genes which GAM177 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26695]

[26696]

[26697] B-cell cll/lymphoma 7a (BCL7A, Accession NM_020993.2) is a GAM177 target gene, herein designated TARGET GENE. BCL7A BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by BCL7A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BCL7A BINDING SITE, designated SEQ ID:9800, to the nucleotide sequence of GAM177 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:385.

[26698] A function of GAM177 is therefore inhibition of B-cell cll/lymphoma 7a (BCL7A, Accession NM_020993.2) . Accordingly, utilities of GAM177 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL7A.

[26699] CLONE24945 (Accession NM_015683.1) is another GAM177 target gene, herein designated TARGET GENE. CLONE24945 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CLONE24945, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLONE24945 BINDING SITE, designated SEQ ID:4969, to the nucleotide sequence of GAM177 RNA, herein designated GAM RNA, also designated SEQ ID:385.

[26700] Another function of GAM177 is therefore inhibition of CLONE24945 (Accession NM_015683.1) . Accordingly, utilities of GAM177 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLONE24945.

[26701] Protein tyrosine phosphatase, non-receptor type 3

(PTPN3, Accession NM_002829.2) is another GAM177 target gene, herein designated TARGET GENE. PTPN3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PTPN3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTPN3 BINDING SITE, designated SEQ ID:12354, to the nucleotide sequence of GAM177 RNA, herein designated GAM RNA, also designated SEQ ID:385.

[26702] Another function of GAM177 is therefore inhibition of Protein tyrosine phosphatase, non-receptor type 3 (PTPN3, Accession NM_002829.2) . Accordingly, utilities of GAM177 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPN3.

[26703]

[26704] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 178 (GAM178), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26705] GAM178 is a novel bioinformatically detected regulatory,

non protein coding, micro RNA (miRNA) gene. The method by which GAM178 was detected is described hereinabove with reference to Figs. 8-15.

[26706] GAM178 gene, herein designated GAM GENE, and GAM178 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[26707] GAM178 gene encodes a GAM178 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM178 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM178 precursor RNA is designated SEQ ID:32, and is provided hereinbelow with reference to the sequence listing part.

[26708] GAM178 precursor RNA folds onto itself, forming GAM178 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26709] GAM178 precursor RNA folds onto itself, forming GAM178 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[26710] Nucleotide sequence of GAM178 precursor RNA, designated SEQ-ID: 32, and a schematic representation of a predicted secondary folding of GAM178 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[26711] An enzyme complex designated DICER COMPLEX, `dices` the GAM178 folded precursor RNA into GAM178 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM178 RNA is desig-

nated SEQ ID:223, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[26712] GAM178 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM178 target RNA, herein designated GAM TARGET RNA. GAM178 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[26713] GAM178 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM178 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM178 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM178 RNA may have a different number of target

binding sites in untranslated regions of a GAM178 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26714] The complementary binding of GAM178 RNA, herein designated GAM RNA, to target binding sites on GAM178 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM178 target RNA into GAM178 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26715] It is appreciated that GAM178 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM178 target genes. The mRNA of each one of this plurality of GAM178 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM178 RNA, herein designated GAM RNA, and which when bound by GAM178 RNA causes inhibition of translation of respective one or more GAM178 target proteins.

[26716] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM178 gene, herein designated GAM GENE, on one or more GAM178 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26717] It is appreciated that specific functions and accordingly utilities of GAM178 correlate with, and may be deduced from, the identity of the target genes which GAM178 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26718]

[26719]

[26720] Digeorge syndrome critical region gene 2 (DGCR2, Accession NM_005137.1) is a GAM178 target gene, herein designated TARGET GENE. DGCR2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DGCR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DGCR2 BINDING SITE, designated SEQ ID:17601, to the nucleotide sequence of GAM178 RNA, herein designated GAM RNA, also designated SEQ ID:223.

[26721] A function of GAM178 is therefore inhibition of Digeorge syndrome critical region gene 2 (DGCR2, Accession NM_005137.1), a gene which is putative adhesion receptor and intervenes in cell- cell or cell- matrix interactions and therefore may be associated with Digeorge syndrome . Accordingly, utilities of GAM178 include diagnosis, prevention and treatment of Digeorge syndrome ., and of other diseases and clinical conditions associated with DGCR2.

[26722] The function of DGCR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to GAM84.1.Dual-specificity tyrosine-(y)-phosphorylation regulated kinase 1a (DYRK1A, Accession NM_130436.1) is another GAM178 target gene, herein designated TARGET GENE. DYRK1A BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DYRK1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DYRK1A BINDING SITE, designated SEQ ID:7463, to the nucleotide sequence of GAM178 RNA, herein designated GAM RNA, also designated SEQ ID:223.

[26723] Another function of GAM178 is therefore inhibition of Dual-specificity tyrosine-(y)-phosphorylation regulated kinase 1a (DYRK1A, Accession NM_130436.1), a gene which regulates cell proliferation and may be involved in brain development . and therefore may be associated with Down syndrome. Accordingly, utilities of GAM178 include diagnosis, prevention and treatment of Down syndrome, and of other diseases and clinical conditions associated with DYRK1A.

[26724] The function of DYRK1A and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to GAM63.1.FLJ11795 (Accession NM_024669.1) is another GAM178 target gene, herein designated TARGET GENE. FLJ11795 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11795, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11795 BINDING SITE, designated SEQ ID:8358, to the nucleotide sequence of GAM178 RNA, herein designated GAM RNA, also designated SEQ ID:223.

[26725] Another function of GAM178 is therefore inhibition of FLJ11795 (Accession NM_024669.1) . Accordingly, utilities of GAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11795.

[26726] Junctional adhesion molecule 1 (JAM1, Accession) is another GAM178 target gene, herein designated TARGET GENE. JAM1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by JAM1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide se-

quences of JAM1 BINDING SITE, designated SEQ ID:7807, to the nucleotide sequence of GAM178 RNA, herein designated GAM RNA, also designated SEQ ID:223.

[26727] Another function of GAM178 is therefore inhibition of Junctional adhesion molecule 1 (JAM1, Accession) . Accordingly, utilities of GAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JAM1.

[26728] Kelch-like 3 (drosophila) (KLHL3, Accession NM_017415.1) is another GAM178 target gene, herein designated TARGET GENE. KLHL3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KLHL3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KLHL3 BINDING SITE, designated SEQ ID:5694, to the nucleotide sequence of GAM178 RNA, herein designated GAM RNA, also designated SEQ ID:223.

[26729] Another function of GAM178 is therefore inhibition of Kelch-like 3 (drosophila) (KLHL3, Accession NM_017415.1) . Accordingly, utilities of GAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL3.

[26730] LOC221596 (Accession) is another GAM178 target gene, herein designated TARGET GENE. LOC221596 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC221596, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221596 BINDING SITE, designated SEQ ID:13446, to the nucleotide sequence of GAM178 RNA, herein designated GAM RNA, also designated SEQ ID:223.

[26731] Another function of GAM178 is therefore inhibition of LOC221596 (Accession) . Accordingly, utilities of GAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221596.

[26732] O-linked n-acetylglucosamine (glcnac) transferase (udp-n-acetylglucosamine:polypeptide-n-acetylglucosaminyl transferase) (OGT, Accession NM_003605.2) is another GAM178 target gene, herein designated TARGET GENE. OGT BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by OGT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of OGT BINDING SITE, designated SEQ ID:16443, to the nucleotide sequence of GAM178 RNA, herein designated GAM RNA, also designated SEQ ID:223.

[26733] Another function of GAM178 is therefore inhibition of O-linked n-acetylglucosamine (glcnac) transferase (udp-n-acetylglucosamine:polypeptide-n-acetylglucosaminyl transferase) (OGT, Accession NM_003605.2), a gene which has a role in the glycosylation of nuclear and cytoplasmic proteins. Accordingly, utilities of GAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OGT.

[26734] The function of OGT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM100.1.Protein tyrosine phosphatase, receptor type, u (PTPRU, Accession NM_005704.2) is another GAM178 target gene, herein designated TARGET GENE. PTPRU BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PTPRU, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of PTPRU BINDING SITE, designated SEQ ID:17915, to the nucleotide sequence of GAM178 RNA, herein designated GAM RNA, also designated SEQ ID:223.

[26735] Another function of GAM178 is therefore inhibition of Protein tyrosine phosphatase, receptor type, u (PTPRU, Accession NM_005704.2) . Accordingly, utilities of GAM178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRU.

[26736]

[26737] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 179 (GAM179), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[26738] GAM179 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM179 was detected is described hereinabove with reference to Figs. 8-15.

[26739] GAM179 gene, herein designated GAM GENE, and GAM179 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[26740] GAM179 gene encodes a GAM179 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM179 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM179 precursor RNA is designated SEQ ID:19, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:19 is located at position 33981297 relative to chromosome 15.

[26741] GAM179 precursor RNA folds onto itself, forming GAM179 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26742] GAM179 precursor RNA folds onto itself, forming GAM179 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is

due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[26743] Nucleotide sequence of GAM179 precursor RNA, designated SEQ-ID: 19, and a schematic representation of a predicted secondary folding of GAM179 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[26744] An enzyme complex designated DICER COMPLEX, `dices` the GAM179 folded precursor RNA into GAM179 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: B) nucleotide sequence of GAM179 RNA is designated SEQ ID:300, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[26745] GAM179 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM179 target

RNA, herein designated GAM TARGET RNA. GAM179 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[26746] GAM179 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM179 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM179 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM179 RNA may have a different number of target binding sites in untranslated regions of a GAM179 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[26747] The complementary binding of GAM179 RNA, herein designated GAM RNA, to target binding sites on GAM179 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM179 target RNA into GAM179 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[26748] It is appreciated that GAM179 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM179 target genes. The mRNA of each one of this plurality of GAM179 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM179 RNA, herein designated GAM RNA, and which when bound by GAM179 RNA causes inhibition of translation of respective one or more GAM179 target proteins.

[26749] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM179 gene, herein designated GAM GENE, on one or more GAM179 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes.

As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[26750] It is appreciated that specific functions and accordingly utilities of GAM179 correlate with, and may be deduced from, the identity of the target genes which GAM179 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26751]

[26752]

[26753] 7h3 (Accession NP_149014.2) is a GAM179 target gene, herein designated TARGET GENE. 7h3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by 7h3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of 7h3 BINDING SITE, designated SEQ ID:1101, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26754] A function of GAM179 is therefore inhibition of 7h3 (Accession NP_149014.2) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with 7h3.

[26755] Active bcr-related gene (ABR, Accession NP_068781.1) is another GAM179 target gene, herein designated TARGET GENE. ABR BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ABR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABR BINDING SITE, designated SEQ ID:16042, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26756] Another function of GAM179 is therefore inhibition of Active bcr-related gene (ABR, Accession NP_068781.1), a gene which gtpase- activating protein for rac and cdc42. and therefore may be associated with Medulloblastoma.

Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of Medulloblastoma, and of other diseases and clinical conditions associated with ABR.

[26757] The function of ABR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM94.1.Active bcr-related gene (ABR, Accession NP_001083.1) is another GAM179 target gene, herein designated TARGET GENE. ABR BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ABR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABR BINDING SITE, designated SEQ ID:16042, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26758] Another function of GAM179 is therefore inhibition of Active bcr-related gene (ABR, Accession NP_001083.1), a gene which gtpase- activating protein for rac and cdc42. and therefore may be associated with Medulloblastoma. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of Medulloblastoma, and of other

diseases and clinical conditions associated with ABR.

[26759] The function of ABR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM94.1.Ap1 gamma subunit binding protein 1 (AP1GBP1, Accession NP_542118.1) is another GAM179 target gene, herein designated TARGET GENE. AP1GBP1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AP1GBP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AP1GBP1 BINDING SITE, designated SEQ ID:16827, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26760] Another function of GAM179 is therefore inhibition of Ap1 gamma subunit binding protein 1 (AP1GBP1, Accession NP_542118.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1GBP1.

[26761] Ap1 gamma subunit binding protein 1 (AP1GBP1, Accession NP_542117.1) is another GAM179 target gene, herein

designated TARGET GENE. AP1GBP1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AP1GBP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AP1GBP1 BINDING SITE, designated SEQ ID:16827, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26762] Another function of GAM179 is therefore inhibition of Ap1 gamma subunit binding protein 1 (AP1GBP1, Accession NP_542117.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1GBP1.

[26763] Ap1 gamma subunit binding protein 1 (AP1GBP1, Accession NP_009178.2) is another GAM179 target gene, herein designated TARGET GENE. AP1GBP1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AP1GBP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AP1GBP1 BINDING SITE, designated SEQ ID:16827, to the

nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26764] Another function of GAM179 is therefore inhibition of Ap1 gamma subunit binding protein 1 (AP1GBP1, Accession NP_009178.2) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1GBP1.

[26765] APRG1 (Accession NP_848031.1) is another GAM179 target gene, herein designated TARGET GENE. APRG1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by APRG1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APRG1 BINDING SITE, designated SEQ ID:15841, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26766] Another function of GAM179 is therefore inhibition of APRG1 (Accession NP_848031.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APRG1.

[26767] Atpase, class vi, type 11b (ATP11B, Accession

XP_087254.2) is another GAM179 target gene, herein designated TARGET GENE. ATP11B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ATP11B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP11B BINDING SITE, designated SEQ ID:4094, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26768] Another function of GAM179 is therefore inhibition of Atpase, class vi, type 11b (ATP11B, Accession XP_087254.2), a gene which is phosphorylated in their intermediate state, drives uphill transport of ions across membranes. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP11B.

[26769] The function of ATP11B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM66.2.Bactericidal/permeability-increasing protein (BPI, Accession NP_001716.1) is another GAM179 target gene, herein designated TARGET GENE. BPI BINDING SITE

is a target binding site found in the 3` untranslated region of mRNA encoded by BPI, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BPI BINDING SITE, designated SEQ ID:12380, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26770] Another function of GAM179 is therefore inhibition of Bactericidal/permeability-increasing protein (BPI, Accession NP_001716.1), a gene which is associated with human neutrophil granules and has bactericidal activity on gram- negative organisms. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BPI.

[26771] The function of BPI has been established by previous studies. Using oligonucleotides derived from the human BPI protein sequence to screen a human genomic library, Gray et al. (1989) isolated BPI genomic sequence. They screened a dimethyl sulfoxide- induced HL- 60 cell cDNA library with oligonucleotides based on the genomic sequence and isolated a full- length human BPI cDNA. The cDNA predicts a 31- amino acid signal peptide followed

by a 456- amino acid mature protein. The N- terminal half of the protein, which exhibits the antimicrobial activity, is basic and hydrophilic, whereas the C- terminal half is slightly acidic and contains several potential transmembrane regions. The difference between the calculated molecular mass of 50.6 kD and the experimental mass of approximately 58 kD may reflect the usage of 2 potential N- linked glycosylation sites. Northern blot analysis detected a 2- kb BPI transcript in mRNA prepared from the spleen of a patient with CML (OMIM Ref. No. 151410); a lower level of BPI expression was found in normal spleen, but no BPI expression was detected in normal liver, placenta, or brain. Hubacek et al. (1997) found that the BPI gene spans approximately 31.5 kb of DNA and contains 15 exons. Comparison of the genomic structures of BPI, LBP, PLTP (OMIM Ref. No. 172425), and CETP (OMIM Ref. No. 118470), which constitute a family of functionally related proteins, revealed a remarkable conservation of exon/intron junctions and exon size.

[26772]

[26773] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26774] Gray, P. W.; Flaggs, G.; Leong, S. R.; Gumina, R. J.; Weiss, J.; Ooi, C. E.; Elsbach, P. : Cloning of the cDNA of a human neutrophil bactericidal protein: structural and functional correlations. J. Biol. Chem. 264: 9505- 9509, 1989. ; and

[26775] Hubacek, J. A.; Buchler, C.; Aslanidis, C.; Schmitz, G. : The genomic organization of the genes for human lipopolysaccharide binding protein (LBP) and bactericidal permeability increasin.

[26776] Further studies establishing the function and utilities of BPI are found in John Hopkins OMIM database record ID 109195, and in cited publications listed in Table 5, which are hereby incorporated by reference.C14orf92 (Accession NP_055643.1) is another GAM179 target gene, herein designated TARGET GENE. C14orf92 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C14orf92, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf92 BINDING SITE, designated SEQ ID:4439, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26777] Another function of GAM179 is therefore inhibition of

C14orf92 (Accession NP_055643.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf92.

[26778] Chromosome 20 open reading frame 175 (C20orf175, Accession NP_543019.1) is another GAM179 target gene, herein designated TARGET GENE. C20orf175 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C20orf175, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf175 BINDING SITE, designated SEQ ID:6704, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26779] Another function of GAM179 is therefore inhibition of Chromosome 20 open reading frame 175 (C20orf175, Accession NP_543019.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf175.

[26780] C4ST3 (Accession NP_690849.1) is another GAM179 target gene, herein designated TARGET GENE. C4ST3 BINDING SITE is a target binding site found in the 3` untrans-

lated region of mRNA encoded by C4ST3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C4ST3 BINDING SITE, designated SEQ ID:3672, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26781] Another function of GAM179 is therefore inhibition of C4ST3 (Accession NP_690849.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C4ST3.

[26782] Cyclin t2 (CCNT2, Accession NP_001232.1) is another GAM179 target gene, herein designated TARGET GENE. CCNT2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CCNT2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCNT2 BINDING SITE, designated SEQ ID:12201, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26783] Another function of GAM179 is therefore inhibition of Cy-

clin t2 (CCNT2, Accession NP_001232.1), a gene which is a regulatory subunit of the cyclin- dependent kinase pair (cdk9/cyclin t) complex. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCNT2.

[26784] The function of CCNT2 has been established by previous studies. Positive transcription elongation factor b (OMIM Ref. No. P- TEFb) is thought to facilitate the transition from abortive to productive elongation by phosphorylating the C- terminal domain (CTD) of the largest subunit of RNA polymerase II (POLR2A; 180660). Drosophila P- TEFb is composed of CDK9 (OMIM Ref. No. 603251) and cyclin T. By searching an EST database for homologs of Drosophila cyclin T, Peng et al. (1998) identified cDNAs encoding human cyclins T1 (OMIM Ref. No. 602506) and T2. Alternative splicing of the primary T2 transcript results in 2 isoforms termed T2a and T2b. The predicted 663- amino acid T2a and 730- amino acid T2b isoforms have different C- termini. Within the conserved N- terminal cyclin box region, cyclin T2 shares 64% and 81% identity with Drosophila cyclin T and human cyclin T1, respectively. Immunoprecipitation studies demonstrated that CDK9 is complexed with the cyclins T1 and T2 in HeLa cell

nuclear extracts. Approximately 80% of CDK9 is complexed with cyclin T1, 10% with cyclin T2a and 10% with T2b. Each complex is an active P- TEFb molecule that can phosphorylate the CTD of RNA polymerase II and cause the transition from abortive elongation into productive elongation. When expressed in mammalian cells, all 3 CDK9/cyclin T combinations strongly activated a CMV promoter. Northern blot analysis revealed that cyclin T2 was expressed as multiple mRNAs in all human tissues tested. Yang et al. (2001) identified 7SK snRNA (OMIM Ref. No. 606515) as a specific P- TEFb- associated factor. 7SK inhibits general and HIV- 1 Tat- specific transcriptional activities of P- TEFb in vivo and in vitro by inhibiting the kinase activity of CDK9 and preventing recruitment of P-TEFb to the HIV- 1 promoter. 7SK is efficiently dissociated from P- TEFb (the CDK9/cyclin T1 heterodimer) by treatment of cells with ultraviolet irradiation and actinomycin D. As these 2 agents have been shown to enhance significantly HIV- 1 transcription and phosphorylation of Pol- II, Yang et al. (2001) concluded that their data provide a mechanistic explanation for this stimulatory effect. Yang et al. (2001) further suggested that the 7SK/P- TEFb interaction may serve as a principal control point for the in-

duction of cellular and HIV- 1 viral gene expression during stress- related responses. The study demonstrated the involvement of an snRNA in controlling the activity of CDK/cyclin kinase.

[26785]

[26786] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26787] Peng, J.; Zhu, Y.; Milton, J. T.; Price, D. H. : Identification of multiple cyclin subunits of human P- TEFb. Genes Dev. 12: 755- 762, 1998. ; and

[26788] Yang, Z.; Zhu, Q.; Luo, K.; Zhou, Q. : The 7SK small nuclear RNA inhibits the CDK9/cyclin T1 kinase to control transcription. Nature 414: 317- 322, 2001.

[26789] Further studies establishing the function and utilities of CCNT2 are found in John Hopkins OMIM database record ID 603862, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cyclin t2 (CCNT2, Accession NP_490595.1) is another GAM179 target gene, herein designated TARGET GENE. CCNT2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CCNT2, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCNT2 BINDING SITE, designated SEQ ID:12201, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26790] Another function of GAM179 is therefore inhibition of Cyclin t2 (CCNT2, Accession NP_490595.1), a gene which is a regulatory subunit of the cyclin- dependent kinase pair (cdk9/cyclin t) complex. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCNT2.

[26791] The function of CCNT2 has been established by previous studies. Positive transcription elongation factor b (OMIM Ref. No. P- TEFb) is thought to facilitate the transition from abortive to productive elongation by phosphorylating the C- terminal domain (CTD) of the largest subunit of RNA polymerase II (POLR2A; 180660). Drosophila P- TEFb is composed of CDK9 (OMIM Ref. No. 603251) and cyclin T. By searching an EST database for homologs of Drosophila cyclin T, Peng et al. (1998) identified cDNAs encoding human cyclins T1 (OMIM Ref. No. 602506) and T2. Alternative splicing of the primary T2 transcript re-

sults in 2 isoforms termed T2a and T2b. The predicted 663- amino acid T2a and 730- amino acid T2b isoforms have different C- termini. Within the conserved N- terminal cyclin box region, cyclin T2 shares 64% and 81% identity with Drosophila cyclin T and human cyclin T1, respectively. Immunoprecipitation studies demonstrated that CDK9 is complexed with the cyclins T1 and T2 in HeLa cell nuclear extracts. Approximately 80% of CDK9 is complexed with cyclin T1, 10% with cyclin T2a and 10% with T2b. Each complex is an active P- TEFb molecule that can phosphorylate the CTD of RNA polymerase II and cause the transition from abortive elongation into productive elongation. When expressed in mammalian cells, all 3 CDK9/cyclin T combinations strongly activated a CMV promoter. Northern blot analysis revealed that cyclin T2 was expressed as multiple mRNAs in all human tissues tested. Yang et al. (2001) identified 7SK snRNA (OMIM Ref. No. 606515) as a specific P- TEFb- associated factor. 7SK inhibits general and HIV- 1 Tat- specific transcriptional activities of P- TEFb in vivo and in vitro by inhibiting the kinase activity of CDK9 and preventing recruitment of P- TEFb to the HIV- 1 promoter. 7SK is efficiently dissociated from P- TEFb (the CDK9/cyclin T1 heterodimer) by treat-

ment of cells with ultraviolet irradiation and actinomycin D. As these 2 agents have been shown to enhance significantly HIV- 1 transcription and phosphorylation of Pol- II, Yang et al. (2001) concluded that their data provide a mechanistic explanation for this stimulatory effect. Yang et al. (2001) further suggested that the 7SK/P- TEFb interaction may serve as a principal control point for the induction of cellular and HIV- 1 viral gene expression during stress- related responses. The study demonstrated the involvement of an snRNA in controlling the activity of CDK/cyclin kinase.

[26792]

[26793] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26794] Peng, J.; Zhu, Y.; Milton, J. T.; Price, D. H. : Identification of multiple cyclin subunits of human P- TEFb. Genes Dev. 12: 755- 762, 1998. ; and

[26795] Yang, Z.; Zhu, Q.; Luo, K.; Zhou, Q. : The 7SK small nuclear RNA inhibits the CDK9/cyclin T1 kinase to control transcription. Nature 414: 317- 322, 2001.

[26796] Further studies establishing the function and utilities of CCNT2 are found in John Hopkins OMIM database record

ID 603862, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cytidine deaminase (CDA, Accession NP_001776.1) is another GAM179 target gene, herein designated TARGET GENE. CDA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CDA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDA BINDING SITE, designated SEQ ID:17937, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26797] Another function of GAM179 is therefore inhibition of Cytidine deaminase (CDA, Accession NP_001776.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDA.

[26798] Cysteine-rich protein 1 (intestinal) (CRIP1, Accession NP_001302.1) is another GAM179 target gene, herein designated TARGET GENE. CRIP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CRIP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CRIP1 BINDING SITE, designated SEQ ID:12094, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26799] Another function of GAM179 is therefore inhibition of Cysteine-rich protein 1 (intestinal) (CRIP1, Accession NP_001302.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRIP1.

[26800] DKFZP434P211 (Accession NP_055364.1) is another GAM179 target gene, herein designated TARGET GENE. DKFZP434P211 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP434P211, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434P211 BINDING SITE, designated SEQ ID:12743, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26801] Another function of GAM179 is therefore inhibition of DKFZP434P211 (Accession NP_055364.1) . Accordingly, utili-

ties of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P211.

[26802] DKFZp762E1312 (Accession NP_060880.2) is another GAM179 target gene, herein designated TARGET GENE. DKFZp762E1312 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZp762E1312, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp762E1312 BINDING SITE, designated SEQ ID:9021, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26803] Another function of GAM179 is therefore inhibition of DKFZp762E1312 (Accession NP_060880.2) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762E1312.

[26804] DKFZP762N2316 (Accession XP_040560.4) is another GAM179 target gene, herein designated TARGET GENE. DKFZP762N2316 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts

of mRNA encoded by DKFZP762N2316, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP762N2316 BINDING SITE, designated SEQ ID:10781, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26805] Another function of GAM179 is therefore inhibition of DKFZP762N2316 (Accession XP_040560.4) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP762N2316.

[26806] Dynein, axonemal, light polypeptide 4 (DNAL4, Accession NP_005731.1) is another GAM179 target gene, herein designated TARGET GENE. DNAL4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DNAL4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DNAL4 BINDING SITE, designated SEQ ID:2920, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26807] Another function of GAM179 is therefore inhibition of

Dynein, axonemal, light polypeptide 4 (DNAL4, Accession NP_005731.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAL4.

[26808] Deoxynucleotidyltransferase, terminal (DNTT, Accession NP_004079.2) is another GAM179 target gene, herein designated TARGET GENE. DNTT BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DNTT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DNTT BINDING SITE, designated SEQ ID:13119, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26809] Another function of GAM179 is therefore inhibition of Deoxynucleotidyltransferase, terminal (DNTT, Accession NP_004079.2), a gene which is terminal deoxynucleotidyl transferase. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNTT.

[26810] The function of DNTT and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to GAM129.1.Docking protein 4 (DOK4, Accession NP_060580.2) is another GAM179 target gene, herein designated TARGET GENE. DOK4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DOK4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DOK4 BINDING SITE, designated SEQ ID:15066, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26811] Another function of GAM179 is therefore inhibition of Docking protein 4 (DOK4, Accession NP_060580.2) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DOK4.

[26812] Down syndrome critical region gene 1 (DSCR1, Accession NP_004405.2) is another GAM179 target gene, herein designated TARGET GENE. DSCR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DSCR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DSCR1 BINDING SITE, designated SEQ ID:18056, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26813] Another function of GAM179 is therefore inhibition of Down syndrome critical region gene 1 (DSCR1, Accession NP_004405.2), a gene which inhibits calcineurin- dependent transcriptional responses. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSCR1.

[26814] The function of DSCR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM96.1.Ectodermal dysplasia 1, anhidrotic (ED1, Accession NP_001390.1) is another GAM179 target gene, herein designated TARGET GENE. ED1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ED1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ED1 BINDING SITE, designated SEQ ID:7504, to the nucleotide sequence of

GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26815] Another function of GAM179 is therefore inhibition of Ectodermal dysplasia 1, anhidrotic (ED1, Accession NP_001390.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ED1.

[26816] Fibulin 1 (FBLN1, Accession NP_006476.1) is another GAM179 target gene, herein designated TARGET GENE. FBLN1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FBLN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FBLN1 BINDING SITE, designated SEQ ID:9477, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26817] Another function of GAM179 is therefore inhibition of Fibulin 1 (FBLN1, Accession NP_006476.1), a gene which secreted glycoprotein; has EGF- like repeats, similar to anaphylatoxins C3a, C4a, and C5a. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBLN1.

[26818] The function of FBLN1 has been established by previous studies. Fibulin- 1 was first described as an integrin-binding fibulin from human placenta by Argraves et al. (1989), who found that it is a secreted glycoprotein that becomes incorporated into a fibrillar extracellular matrix when expressed in cultured cells or added exogenously to cell monolayers. Preliminary electron microscopic data suggested a rod- like structure for fibulin- 1, consistent with the sequence predictions. Calcium- binding to fibulin- 1 is apparently required to mediate its binding to laminin and nidogen (OMIM Ref. No. 131390). By in situ hybridization of tritium- labeled cDNA probes, Mattei et al. (1994) assigned the human FBLN1 gene to 22q13.2-q13.3 and assigned its counterpart in mouse to the E- F band of chromosome 15. Korenberg et al. (1995) assigned the FBLN1 gene to 22q13.3 by fluorescence in situ hybridization.

[26819]

[26820] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26821] Korenberg, J. R.; Chen, X.- N.; Tran, H.; Argraves, W. S. : Localization of the human gene for fibulin- 1 (FBLN1) to

chromosome band 22q13.3. Cytogenet. Cell Genet. 68: 192- 193, 1995. ; and

[26822] Mattei, M.- G.; Pan, T.- C.; Zhang, R.- Z.; Timpl, R.; Chu, M.- L. : The fibulin- 1 gene (FBLN1) is located on human chromosome 22 and on mouse chromosome 15. Genomics 22: 437- 438, 1994.

[26823] Further studies establishing the function and utilities of FBLN1 are found in John Hopkins OMIM database record ID 135820, and in cited publications listed in Table 5, which are hereby incorporated by reference.FLJ10116 (Accession NP_060470.1) is another GAM179 target gene, herein designated TARGET GENE. FLJ10116 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10116, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10116 BINDING SITE, designated SEQ ID:18159, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26824] Another function of GAM179 is therefore inhibition of FLJ10116 (Accession NP_060470.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ10116.

[26825] FLJ10307 (Accession NP_060523.2) is another GAM179 target gene, herein designated TARGET GENE. FLJ10307 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10307, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10307 BINDING SITE, designated SEQ ID:16190, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26826] Another function of GAM179 is therefore inhibition of FLJ10307 (Accession NP_060523.2) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10307.

[26827] FLJ10462 (Accession NP_060569.3) is another GAM179 target gene, herein designated TARGET GENE. FLJ10462 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ10462, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ10462 BINDING SITE, designated SEQ ID:9026, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26828] Another function of GAM179 is therefore inhibition of FLJ10462 (Accession NP_060569.3) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10462.

[26829] FLJ13215 (Accession NP_079280.1) is another GAM179 target gene, herein designated TARGET GENE. FLJ13215 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13215, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13215 BINDING SITE, designated SEQ ID:11648, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26830] Another function of GAM179 is therefore inhibition of FLJ13215 (Accession NP_079280.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ13215.

[26831] FLJ13615 (Accession NP_079390.1) is another GAM179 target gene, herein designated TARGET GENE. FLJ13615 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13615, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13615 BINDING SITE, designated SEQ ID:10037, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26832] Another function of GAM179 is therefore inhibition of FLJ13615 (Accession NP_079390.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13615.

[26833] FLJ13782 (Accession NP_079191.1) is another GAM179 target gene, herein designated TARGET GENE. FLJ13782 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13782, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ13782 BINDING SITE, designated SEQ ID:9784, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26834] Another function of GAM179 is therefore inhibition of FLJ13782 (Accession NP_079191.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13782.

[26835] FLJ13841 (Accession NP_078978.1) is another GAM179 target gene, herein designated TARGET GENE. FLJ13841 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ13841, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13841 BINDING SITE, designated SEQ ID:15474, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26836] Another function of GAM179 is therefore inhibition of FLJ13841 (Accession NP_078978.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13841.

[26837] FLJ20574 (Accession NP_060356.1) is another GAM179 target gene, herein designated TARGET GENE. FLJ20574 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20574, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20574 BINDING SITE, designated SEQ ID:6230, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26838] Another function of GAM179 is therefore inhibition of FLJ20574 (Accession NP_060356.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20574.

[26839] FLJ21870 (Accession NP_075392.1) is another GAM179 target gene, herein designated TARGET GENE. FLJ21870 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ21870, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21870 BINDING SITE, designated SEQ ID:4419, to the

nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26840] Another function of GAM179 is therefore inhibition of FLJ21870 (Accession NP_075392.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21870.

[26841] FLJ31300 (Accession NP_653240.1) is another GAM179 target gene, herein designated TARGET GENE. FLJ31300 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ31300, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31300 BINDING SITE, designated SEQ ID:792, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26842] Another function of GAM179 is therefore inhibition of FLJ31300 (Accession NP_653240.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31300.

[26843] FLJ32934 (Accession NP_653223.1) is another GAM179

target gene, herein designated TARGET GENE. FLJ32934 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32934, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32934 BINDING SITE, designated SEQ ID:19512, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26844] Another function of GAM179 is therefore inhibition of FLJ32934 (Accession NP_653223.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32934.

[26845] FLJ36000 (Accession NP_787101.1) is another GAM179 target gene, herein designated TARGET GENE. FLJ36000 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ36000, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ36000 BINDING SITE, designated SEQ ID:6917, to the nucleotide sequence of GAM179 RNA, herein designated

GAM RNA, also designated SEQ ID:300.

[26846] Another function of GAM179 is therefore inhibition of FLJ36000 (Accession NP_787101.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ36000.

[26847] FLJ38607 (Accession NP_689867.1) is another GAM179 target gene, herein designated TARGET GENE. FLJ38607 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ38607, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ38607 BINDING SITE, designated SEQ ID:8910, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26848] Another function of GAM179 is therefore inhibition of FLJ38607 (Accession NP_689867.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ38607.

[26849] FLJ39005 (Accession NP_848616.1) is another GAM179 target gene, herein designated TARGET GENE. FLJ39005

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ39005, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ39005 BINDING SITE, designated SEQ ID:11931, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26850] Another function of GAM179 is therefore inhibition of FLJ39005 (Accession NP_848616.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ39005.

[26851] FLJ90798 (Accession NP_699198.1) is another GAM179 target gene, herein designated TARGET GENE. FLJ90798 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ90798, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ90798 BINDING SITE, designated SEQ ID:660, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26852] Another function of GAM179 is therefore inhibition of FLJ90798 (Accession NP_699198.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ90798.

[26853] G protein-coupled receptor 48 (GPR48, Accession NP_060960.1) is another GAM179 target gene, herein designated TARGET GENE. GPR48 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPR48, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPR48 BINDING SITE, designated SEQ ID:14773, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26854] Another function of GAM179 is therefore inhibition of G protein-coupled receptor 48 (GPR48, Accession NP_060960.1), a gene which binds to follicle- stimulating hormone and thyroid- stimulating hormone. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR48.

[26855] The function of GPR48 has been established by previous studies. By EST database searching with known GPCRs as queries, Hsu et al. (1998) identified ESTs encoding transmembrane domains 4 and 5 of human GPR48, which they called LGR4. By RT- PCR and repeated screening of a rat ovary cDNA library, they isolated a full- length cDNA encoding rat Lgr4. Sequence analysis predicted that the 951- amino acid rat Lgr4 protein contains a signal peptide; N- and C- flanking cysteine- rich sequences separated by 17 LRRs; 5 potential N- glycosylation sites; a transmembrane region; and a 145- residue cytoplasmic tail with multiple phosphorylation sites and a conserved potential protein kinase A (see OMIM Ref. No. 176911) phosphorylation site. Northern blot analysis of human tissues detected a 5.5- kb LGR4 transcript in multiple steroidogenic tissues and in a number of other tissues. Functional analysis showed that expression of a chimeric receptor composed of the extracellular domain of luteinizing hormone receptor (OMIM Ref. No. 152790) with the transmembrane and cytoplasmic domains of Lgr4 resulted in binding of hCG (OMIM Ref. No. 118860) but no increase in basal production of cAMP, suggesting that LGR4 may signal through another mechanism. Loh et al.

(2001) cloned human GPR48. Like rat Lgr4, the deduced human GPR48 protein has 951 amino acids and a similar structure. Northern blot analysis detected wide expression of GPR48 that was highest in pancreas. Within brain, highest expression of GPR48 was in hippocampus and amygdala. Expression of Gpr48 in mouse embryos occurred as early as embryonic day 7 and peaked at day 15.

[26856]

[26857] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26858] Hsu, S. Y.; Liang, S.- G.; Hsueh, A. J. W. : Characterization of two LGR genes homologous to gonadotropin and thyrotropin receptors with extracellular leucine- rich repeats and a G protein- coupled, seven- transmembrane region. Molec. Endocr. 12: 1830- 1845, 1998. ; and

[26859] Loh, E. D.; Broussard, S. R.; Kolakowski, L. F. : Molecular characterization of a novel glycoprotein hormone G- protein- coupled receptor. Biochem. Biophys. Res. Commun. 282: 757- 764, 2001.

[26860] Further studies establishing the function and utilities of GPR48 are found in John Hopkins OMIM database record ID 606666, and in cited publications listed in Table 5,

which are hereby incorporated by reference.Grip1 associated protein 1 (GRIPAP1, Accession NP_064522.2) is another GAM179 target gene, herein designated TARGET GENE. GRIPAP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GRIPAP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GRIPAP1 BINDING SITE, designated SEQ ID:19328, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26861] Another function of GAM179 is therefore inhibition of Grip1 associated protein 1 (GRIPAP1, Accession NP_064522.2) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRIPAP1.

[26862] Hyaluronan binding protein 2 (HABP2, Accession NP_004123.1) is another GAM179 target gene, herein designated TARGET GENE. HABP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HABP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HABP2 BINDING SITE, designated SEQ ID:17826, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26863] Another function of GAM179 is therefore inhibition of Hyaluronan binding protein 2 (HABP2, Accession NP_004123.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HABP2.

[26864] Interleukin 16 (lymphocyte chemoattractant factor) (IL16, Accession NP_004504.3) is another GAM179 target gene, herein designated TARGET GENE. IL16 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by IL16, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL16 BINDING SITE, designated SEQ ID:9723, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26865] Another function of GAM179 is therefore inhibition of Interleukin 16 (lymphocyte chemoattractant factor) (IL16,

Accession NP_004504.3), a gene which modulates T- cell activation. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL16.

[26866] The function of IL16 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM66.1.Interleukin 16 (lymphocyte chemoattractant factor) (IL16, Accession NP_757366.1) is another GAM179 target gene, herein designated TARGET GENE. IL16 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by IL16, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL16 BINDING SITE, designated SEQ ID:9723, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26867] Another function of GAM179 is therefore inhibition of Interleukin 16 (lymphocyte chemoattractant factor) (IL16, Accession NP_757366.1), a gene which modulates T- cell activation. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with IL16.

[26868] The function of IL16 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM66.1.Interleukin 1, beta (IL1B, Accession NP_000567.1) is another GAM179 target gene, herein designated TARGET GENE. IL1B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IL1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL1B BINDING SITE, designated SEQ ID:4722, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26869] Another function of GAM179 is therefore inhibition of Interleukin 1, beta (IL1B, Accession NP_000567.1), a gene which stimulates thymocyte proliferation. and therefore may be associated with Gastric cancer risk after h. pylori infection. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of Gastric cancer risk after h. pylori infection, and of other diseases and clinical conditions associated with IL1B.

[26870] The function of IL1B has been established by previous

studies. Interleukin- 1, produced mainly by blood monocytes, mediates the panoply of host reactions collectively known as acute phase response. It is identical to endogenous pyrogen. The multiple biologic activities that define IL1 are properties of a 15- to 18- kD protein that is derived from a 30- to 35- kD precursor. El- Omar et al. (2000) reported that interleukin- 1 gene cluster polymorphisms suspected of enhancing production of interleukin-1- beta are associated with an increased risk of both hypochlorhydria induced by Helicobacter pylori and gastric cancer. Two of these polymorphisms are in near-complete linkage disequilibrium, and 1 is a TATA- box polymorphism that markedly affects DNA- protein interactions in vitro. The association with disease may be explained by the biologic properties of interleukin- 1- beta, which is an important proinflammatory cytokine and a powerful inhibitor of gastric acid secretion. Host genetic factors that affect interleukin- 1- beta may determine why some individuals infected with H. pylori develop gastric cancer while others do not. IL1- beta is upregulated in the presence of H. pylori and is important in initiating and amplifying the inflammatory response to this infection. Three diallelic polymorphisms in IL1B have been reported,

all representing C- to- T base transitions, at positions - 511, - 31, and +3954 basepairs from the transcriptional start site. To determine whether these polymorphisms are important with respect to different outcomes of H. pylori infections, El- Omar et al. (2000) studied their effects on gastric physiology in healthy subjects. Carriers of the ILB - 31T allele (147720.0001) had an age- adjusted odds ratio of 9.1 (95% confidence interval, 2.2- 37) for low acid secretion, and there was little difference between homozygous and heterozygous carriers. The IL1B +3954 genotype was not associated with the risk of hypochlorhydria. Carriers of IL1B - 31T had an increased gastric cancer risk at an odds ratio of 1.9 (95% confidence interval, 1.5- 2.6), with no significant difference between homozygotes and heterozygotes Hamajima et al. (2001) determined that the C- to- T transition at position - 31, creating a TATA box, is associated with vulnerability to persistent H. pylori infection, and that the susceptibility is modified by smoking

[26871] Animal model experiments lend further support to the function of IL1B. Mature IL1- beta levels are a sensitive and specific indicator of caspase- 1 (OMIM Ref. No. 147678) activation. Ona et al. (1999) studied the effect of inhibition of caspase- 1 on the progression of Huntington

disease (OMIM Ref. No. 143100) in the mouse model developed by Mangiarini et al. (1996), which they called R6/2 mice. Ona et al. (1999) crossed R6/2 mice with a well- characterized transgenic mouse strain expressing a dominant- negative mutant of caspase- 1 in the brain (NSE M17Z). Double mutant mice showed extended survival and delayed appearance of neuronal inclusions, neurotransmitter receptor alterations, and onset of symptoms, indicating that caspase- 1 is important in the pathogenesis of Huntington disease. Mature IL1- beta levels in R6/2 mice were elevated to 268% of those in wild-type controls. This increase was significantly inhibited in the R6/2- NSE M17Z mice. IL1- beta levels in the brains of human patients also exhibited significant increases, to 213% of those in normal controls

[26872] It is appreciated that the abovementioned animal model for IL1B is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[26873] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

E. L.; Bream, J. H.; Young, H. A.; Herrera, J.; Lissowska, J.; Yuan, C.- C.; Rothman, N.; Lanyon, G.; Martin, M.; Fraumeni, J. F., Jr.; Rabkin, C. S. : Interleukin- 1 polymorphisms associated with increased risk of gastric cancer. Nature 404: 398- 402, 2000. Note: Erratum: Nature 412: 99 only, 2001. ; and

[26875] Ona, V. O.; Li, M.; Vonsattel, J. P. G.; Andrews, L. J.; Khan, S. Q.; Chung, W. M.; Frey, A. S.; Menon, A. S.; Li, X.- J.; Stieg, P. E.; Yuan, J.; Penney, J. B.; Young, A. B.; Cha, J.- H.

[26876] Further studies establishing the function and utilities of IL1B are found in John Hopkins OMIM database record ID 147720, and in cited publications listed in Table 5, which are hereby incorporated by reference.Iq motif containing gtpase activating protein 1 (IQGAP1, Accession NP_003861.1) is another GAM179 target gene, herein designated TARGET GENE. IQGAP1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by IQGAP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IQGAP1 BINDING SITE, designated SEQ ID:17358, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA,

also designated SEQ ID:300.

[26877] Another function of GAM179 is therefore inhibition of Iq motif containing gtpase activating protein 1 (IQGAP1, Accession NP_003861.1), a gene which inhibits GTPase activity of ras family of GTP binding proteins Cdc42Hs and rac. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IQGAP1.

[26878] The function of IQGAP1 has been established by previous studies. Sugimoto et al. (2001) demonstrated that IQGAP1, a negative regulator of cell- cell adhesion, is upregulated by gene amplification at 15q26 in 2 gastric cancer cell lines. Amplification at 15q26 had been found in various malignancies, including breast cancers, and FES (OMIM Ref. No. 190030) and/or IGF1R (OMIM Ref. No. 147370) had been identified as targets for gene amplification in breast cancer, melanoma, and pancreatic adenocarcinoma. In contrast, Sugimoto et al. (2001) found that both genes are located telomeric to the amplicon at 15q26 in the 2 gastric cancer cell lines they studied. Fukata et al. (2002) found that IQGAP1, an effector of RAC1 (OMIM Ref. No. 602048) and CDC42, interacts with CLIP170 (RSN; 179838). In Vero fibroblasts, IQGAP1 local-

ized at the polarized leading edge. Expression of a C- terminal fragment of IQGAP1 that included the CLIP170-binding region delocalized GFP- CLIP170 from the tips of microtubules and altered the microtubule array. The authors found that activated RAC1/CDC42, IQGAP1, and CLIP170 form a tripartite complex. Furthermore, expression of an IQGAP1 mutant defective in RAC1/CDC42 binding induced multiple leading edges. These results indicated that RAC1/CDC42 marks special cortical spots where the IQGAP1 and CLIP170 complex is targeted, leading to a polarized microtubule array and cell polarization

[26879]

2997- 3005, 1996.

[26883] Further studies establishing the function and utilities of IQGAP1 are found in John Hopkins OMIM database record ID 603379, and in cited publications listed in Table 5, which are hereby incorporated by reference.Potassium channel, subfamily k, member 4 (KCNK4, Accession NP_201567.1) is another GAM179 target gene, herein designated TARGET GENE. KCNK4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KCNK4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNK4 BINDING SITE, designated SEQ ID:3257, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26884] Another function of GAM179 is therefore inhibition of Potassium channel, subfamily k, member 4 (KCNK4, Accession NP_201567.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNK4.

[26885] Potassium channel, subfamily k, member 4 (KCNK4, Accession NP_057695.2) is another GAM179 target gene,

herein designated TARGET GENE. KCNK4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KCNK4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNK4 BINDING SITE, designated SEQ ID:3257, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26886] Another function of GAM179 is therefore inhibition of Potassium channel, subfamily k, member 4 (KCNK4, Accession NP_057695.2) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNK4.

[26887] Potassium channel, subfamily k, member 4 (KCNK4, Accession NP_201568.1) is another GAM179 target gene, herein designated TARGET GENE. KCNK4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KCNK4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNK4 BINDING SITE, designated SEQ ID:3257, to the nu-

cleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26888] Another function of GAM179 is therefore inhibition of Potassium channel, subfamily k, member 4 (KCNK4, Accession NP_201568.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNK4.

[26889] KIAA0286 (Accession XP_043118.3) is another GAM179 target gene, herein designated TARGET GENE. KIAA0286 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0286, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0286 BINDING SITE, designated SEQ ID:12582, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26890] Another function of GAM179 is therefore inhibition of KIAA0286 (Accession XP_043118.3) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0286.

[26891] KIAA1170 (Accession XP_045907.2) is another GAM179

target gene, herein designated TARGET GENE. KIAA1170 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1170, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1170 BINDING SITE, designated SEQ ID:14096, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26892] Another function of GAM179 is therefore inhibition of KIAA1170 (Accession XP_045907.2) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1170.

[26893] LAK (Accession NP_079420.2) is another GAM179 target gene, herein designated TARGET GENE. LAK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LAK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LAK BINDING SITE, designated SEQ ID:9362, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:300.

[26894] Another function of GAM179 is therefore inhibition of LAK (Accession NP_079420.2) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAK.

[26895] LOC120105 (Accession XP_061864.2) is another GAM179 target gene, herein designated TARGET GENE. LOC120105 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC120105, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC120105 BINDING SITE, designated SEQ ID:12997, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26896] Another function of GAM179 is therefore inhibition of LOC120105 (Accession XP_061864.2) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120105.

[26897] LOC125058 (Accession XP_008617.5) is another GAM179 target gene, herein designated TARGET GENE. LOC125058 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC125058, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC125058 BINDING SITE, designated SEQ ID:10141, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26898] Another function of GAM179 is therefore inhibition of LOC125058 (Accession XP_008617.5) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC125058.

[26899] LOC133926 (Accession XP_059674.1) is another GAM179 target gene, herein designated TARGET GENE. LOC133926 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC133926, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC133926 BINDING SITE, designated SEQ ID:16799, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26900] Another function of GAM179 is therefore inhibition of

LOC133926 (Accession XP_059674.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133926.

[26901] LOC143188 (Accession XP_096387.1) is another GAM179 target gene, herein designated TARGET GENE. LOC143188 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC143188, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC143188 BINDING SITE, designated SEQ ID:8192, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26902] Another function of GAM179 is therefore inhibition of LOC143188 (Accession XP_096387.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143188.

[26903] LOC145098 (Accession XP_085022.1) is another GAM179 target gene, herein designated TARGET GENE. LOC145098 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC145098, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145098 BINDING SITE, designated SEQ ID:13315, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26904] Another function of GAM179 is therefore inhibition of LOC145098 (Accession XP_085022.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145098.

[26905] LOC148894 (Accession XP_097542.1) is another GAM179 target gene, herein designated TARGET GENE. LOC148894 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC148894, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148894 BINDING SITE, designated SEQ ID:3771, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26906] Another function of GAM179 is therefore inhibition of LOC148894 (Accession XP_097542.1) . Accordingly, utili-

ties of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148894.

[26907] LOC149837 (Accession XP_097747.1) is another GAM179 target gene, herein designated TARGET GENE. LOC149837 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC149837, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149837 BINDING SITE, designated SEQ ID:4055, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26908] Another function of GAM179 is therefore inhibition of LOC149837 (Accession XP_097747.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149837.

[26909] LOC150174 (Accession XP_086802.2) is another GAM179 target gene, herein designated TARGET GENE. LOC150174 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150174, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150174 BINDING SITE, designated SEQ ID:12743, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26910] Another function of GAM179 is therefore inhibition of LOC150174 (Accession XP_086802.2) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150174.

[26911] LOC150213 (Accession XP_059324.1) is another GAM179 target gene, herein designated TARGET GENE. LOC150213 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150213, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150213 BINDING SITE, designated SEQ ID:12743, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26912] Another function of GAM179 is therefore inhibition of LOC150213 (Accession XP_059324.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC150213.

[26913] LOC151171 (Accession XP_087116.1) is another GAM179 target gene, herein designated TARGET GENE. LOC151171 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC151171, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151171 BINDING SITE, designated SEQ ID:7338, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26914] Another function of GAM179 is therefore inhibition of LOC151171 (Accession XP_087116.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151171.

[26915] LOC157556 (Accession XP_098783.1) is another GAM179 target gene, herein designated TARGET GENE. LOC157556 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC157556, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC157556 BINDING SITE, designated SEQ ID:18978, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26916] Another function of GAM179 is therefore inhibition of LOC157556 (Accession XP_098783.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157556.

[26917] LOC220980 (Accession XP_167629.1) is another GAM179 target gene, herein designated TARGET GENE. LOC220980 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC220980, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC220980 BINDING SITE, designated SEQ ID:3721, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26918] Another function of GAM179 is therefore inhibition of LOC220980 (Accession XP_167629.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC220980.

[26919] LOC221140 (Accession XP_167908.1) is another GAM179 target gene, herein designated TARGET GENE. LOC221140 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC221140, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221140 BINDING SITE, designated SEQ ID:3664, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26920] Another function of GAM179 is therefore inhibition of LOC221140 (Accession XP_167908.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221140.

[26921] LOC255736 (Accession XP_170898.2) is another GAM179 target gene, herein designated TARGET GENE. LOC255736 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC255736, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC255736 BINDING SITE, designated SEQ ID:14351, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26922] Another function of GAM179 is therefore inhibition of LOC255736 (Accession XP_170898.2) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255736.

[26923] LOC283016 (Accession XP_208024.1) is another GAM179 target gene, herein designated TARGET GENE. LOC283016 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283016, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283016 BINDING SITE, designated SEQ ID:758, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26924] Another function of GAM179 is therefore inhibition of LOC283016 (Accession XP_208024.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283016.

[26925] LOC283048 (Accession XP_210867.1) is another GAM179 target gene, herein designated TARGET GENE. LOC283048 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283048, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283048 BINDING SITE, designated SEQ ID:15999, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26926] Another function of GAM179 is therefore inhibition of LOC283048 (Accession XP_210867.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283048.

[26927] LOC283168 (Accession XP_210910.1) is another GAM179 target gene, herein designated TARGET GENE. LOC283168 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283168, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283168 BINDING SITE, designated SEQ ID:5476, to

the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26928] Another function of GAM179 is therefore inhibition of LOC283168 (Accession XP_210910.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283168.

[26929] LOC283177 (Accession XP_210903.1) is another GAM179 target gene, herein designated TARGET GENE. LOC283177 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283177, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283177 BINDING SITE, designated SEQ ID:2829, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26930] Another function of GAM179 is therefore inhibition of LOC283177 (Accession XP_210903.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283177.

[26931] LOC284124 (Accession XP_294862.1) is another GAM179

target gene, herein designated TARGET GENE. LOC284124 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284124, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284124 BINDING SITE, designated SEQ ID:6917, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26932] Another function of GAM179 is therefore inhibition of LOC284124 (Accession XP_294862.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284124.

[26933] LOC284313 (Accession XP_209116.1) is another GAM179 target gene, herein designated TARGET GENE. LOC284313 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284313, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284313 BINDING SITE, designated SEQ ID:11931, to the nucleotide sequence of GAM179 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:300.

[26934] Another function of GAM179 is therefore inhibition of LOC284313 (Accession XP_209116.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284313.

[26935] LOC284911 (Accession XP_211684.1) is another GAM179 target gene, herein designated TARGET GENE. LOC284911 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284911, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284911 BINDING SITE, designated SEQ ID:9507, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26936] Another function of GAM179 is therefore inhibition of LOC284911 (Accession XP_211684.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284911.

[26937] LOC285193 (Accession XP_209509.1) is another GAM179 target gene, herein designated TARGET GENE. LOC285193

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285193, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285193 BINDING SITE, designated SEQ ID:4970, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26938] Another function of GAM179 is therefore inhibition of LOC285193 (Accession XP_209509.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285193.

[26939] LOC285334 (Accession XP_211844.1) is another GAM179 target gene, herein designated TARGET GENE. LOC285334 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285334, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285334 BINDING SITE, designated SEQ ID:800, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26940] Another function of GAM179 is therefore inhibition of LOC285334 (Accession XP_211844.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285334.

[26941] LOC285412 (Accession XP_208319.1) is another GAM179 target gene, herein designated TARGET GENE. LOC285412 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285412, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285412 BINDING SITE, designated SEQ ID:17899, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26942] Another function of GAM179 is therefore inhibition of LOC285412 (Accession XP_208319.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285412.

[26943] LOC285431 (Accession XP_211898.1) is another GAM179 target gene, herein designated TARGET GENE. LOC285431 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC285431, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285431 BINDING SITE, designated SEQ ID:7608, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26944] Another function of GAM179 is therefore inhibition of LOC285431 (Accession XP_211898.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285431.

[26945] LOC285735 (Accession XP_212002.1) is another GAM179 target gene, herein designated TARGET GENE. LOC285735 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285735, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285735 BINDING SITE, designated SEQ ID:5912, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26946] Another function of GAM179 is therefore inhibition of

LOC285735 (Accession XP_212002.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285735.

[26947] LOC285827 (Accession XP_212038.1) is another GAM179 target gene, herein designated TARGET GENE. LOC285827 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by LOC285827, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285827 BINDING SITE, designated SEQ ID:13258, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26948] Another function of GAM179 is therefore inhibition of LOC285827 (Accession XP_212038.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285827.

[26949] LOC285827 (Accession XP_212645.1) is another GAM179 target gene, herein designated TARGET GENE. LOC285827 BINDING SITE is a target binding site found in the 5` un-

translated region of multiple transcripts of mRNA encoded by LOC285827, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285827 BINDING SITE, designated SEQ ID:13258, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26950] Another function of GAM179 is therefore inhibition of LOC285827 (Accession XP_212645.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285827.

[26951] LOC285827 (Accession XP_212604.1) is another GAM179 target gene, herein designated TARGET GENE. LOC285827 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by LOC285827, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285827 BINDING SITE, designated SEQ ID:13258, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:300.

[26952] Another function of GAM179 is therefore inhibition of LOC285827 (Accession XP_212604.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285827.

[26953] LOC285931 (Accession NP_777609.1) is another GAM179 target gene, herein designated TARGET GENE. LOC285931 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285931, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285931 BINDING SITE, designated SEQ ID:17124, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26954] Another function of GAM179 is therefore inhibition of LOC285931 (Accession NP_777609.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285931.

[26955] LOC286058 (Accession XP_212158.1) is another GAM179 target gene, herein designated TARGET GENE. LOC286058

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286058, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286058 BINDING SITE, designated SEQ ID:17023, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26956] Another function of GAM179 is therefore inhibition of LOC286058 (Accession XP_212158.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286058.

[26957] LOC339808 (Accession XP_295071.1) is another GAM179 target gene, herein designated TARGET GENE. LOC339808 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339808, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339808 BINDING SITE, designated SEQ ID:12230, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26958] Another function of GAM179 is therefore inhibition of LOC339808 (Accession XP_295071.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339808.

[26959] LOC346259 (Accession XP_299387.1) is another GAM179 target gene, herein designated TARGET GENE. LOC346259 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC346259, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC346259 BINDING SITE, designated SEQ ID:16628, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26960] Another function of GAM179 is therefore inhibition of LOC346259 (Accession XP_299387.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC346259.

[26961] LOC347767 (Accession XP_300531.1) is another GAM179 target gene, herein designated TARGET GENE. LOC347767 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC347767, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC347767 BINDING SITE, designated SEQ ID:13207, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26962] Another function of GAM179 is therefore inhibition of LOC347767 (Accession XP_300531.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC347767.

[26963] LOC348155 (Accession XP_211219.1) is another GAM179 target gene, herein designated TARGET GENE. LOC348155 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348155, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348155 BINDING SITE, designated SEQ ID:12472, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26964] Another function of GAM179 is therefore inhibition of

LOC348155 (Accession XP_211219.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348155.

[26965] LOC348182 (Accession XP_302676.1) is another GAM179 target gene, herein designated TARGET GENE. LOC348182 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348182, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348182 BINDING SITE, designated SEQ ID:15435, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26966] Another function of GAM179 is therefore inhibition of LOC348182 (Accession XP_302676.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348182.

[26967] LOC348371 (Accession XP_300722.1) is another GAM179 target gene, herein designated TARGET GENE. LOC348371 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348371, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348371 BINDING SITE, designated SEQ ID:3641, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26968] Another function of GAM179 is therefore inhibition of LOC348371 (Accession XP_300722.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348371.

[26969] LOC348488 (Accession XP_300352.1) is another GAM179 target gene, herein designated TARGET GENE. LOC348488 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348488, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348488 BINDING SITE, designated SEQ ID:8278, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26970] Another function of GAM179 is therefore inhibition of LOC348488 (Accession XP_300352.1) . Accordingly, utili-

ties of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348488.

[26971] LOC349384 (Accession XP_301935.1) is another GAM179 target gene, herein designated TARGET GENE. LOC349384 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349384, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349384 BINDING SITE, designated SEQ ID:10985, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26972] Another function of GAM179 is therefore inhibition of LOC349384 (Accession XP_301935.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349384.

[26973] Mitogen-activated protein kinase 4 (MAPK4, Accession NP_002738.1) is another GAM179 target gene, herein designated TARGET GENE. MAPK4 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MAPK4, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAPK4 BINDING SITE, designated SEQ ID:11406, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26974] Another function of GAM179 is therefore inhibition of Mitogen-activated protein kinase 4 (MAPK4, Accession NP_002738.1), a gene which phosphorylates microtubule-associated protein- 2 may promote entry into the cell cycle. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK4.

[26975] The function of MAPK4 has been established by previous studies. See MAPK1 (OMIM Ref. No. 176948). Gonzalez et al. (1992) reported the molecular cloning of genes for 4 human proteins with high homology to members of the mitogen- activated protein kinase group of enzymes. Of the 4, 2 probably resulted from alternative processing of transcripts from a single gene. Zhu et al. (1994) stated that p63MAPK, which had been known as ERK3, shares only 73% protein sequence identity with rat ERK3. They suggested that p97MAPK (MAPK6; 602904) is the true

ERK3 homolog, and that p63MAPK is a member of the ERK3 subfamily. Garcia et al. (1996) reported that a gene they referred to as MNK2 is the rat homolog of p63MAPK. The 2 protein sequences are 95% identical. Li et al. (1994) used Southern blotting of DNA from a panel of human hamster cell hybrids and fluorescence in situ hybridization to map the MAPK4 gene to 18q12- q21

[26976]

[26977] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26978] Garcia, J. I.; Zalba, G.; Detera- Wadleigh, S. D.; de Miguel, C. : Isolation of a cDNA encoding the rat MAP- kinase homolog of human p63mapk. Mammalian Genome 7: 810-814, 1996. ; and

[26979] Li, L.; Wysk, M.; Gonzalez, F. A.; Davis, R. J. : Genomic loci of human mitogen- activated protein kinases. Oncogene 9: 647- 649, 1994.

[26980] Further studies establishing the function and utilities of MAPK4 are found in John Hopkins OMIM database record ID 176949, and in cited publications listed in Table 5, which are hereby incorporated by reference.MBNL1 (Accession NP_066368.1) is another GAM179 target gene,

herein designated TARGET GENE. MBNL1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MBNL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MBNL1 BINDING SITE, designated SEQ ID:12912, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26981] Another function of GAM179 is therefore inhibition of MBNL1 (Accession NP_066368.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBNL1.

[26982] Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_758866.1) is another GAM179 target gene, herein designated TARGET GENE. MCP BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MCP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MCP BINDING SITE, designated SEQ ID:17253, to the nucleotide

sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26983] Another function of GAM179 is therefore inhibition of Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_758866.1), a gene which may be involved in the regulation of complement activation. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCP.

[26984] The function of MCP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_722548.1) is another GAM179 target gene, herein designated TARGET GENE. MCP BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MCP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MCP BINDING SITE, designated SEQ ID:17253, to the nucleotide sequence of GAM179 RNA, herein designated

GAM RNA, also designated SEQ ID:300.

[26985] Another function of GAM179 is therefore inhibition of Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_722548.1), a gene which may be involved in the regulation of complement activation. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCP.

[26986] The function of MCP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_758868.1) is another GAM179 target gene, herein designated TARGET GENE. MCP BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MCP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MCP BINDING SITE, designated SEQ ID:17253, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26987] Another function of GAM179 is therefore inhibition of Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_758868.1), a gene which may be involved in the regulation of complement activation. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCP.

[26988] The function of MCP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_758865.1) is another GAM179 target gene, herein designated TARGET GENE. MCP BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MCP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MCP BINDING SITE, designated SEQ ID:17253, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26989] Another function of GAM179 is therefore inhibition of

Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_758865.1), a gene which may be involved in the regulation of complement activation. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCP.

[26990] The function of MCP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_758867.1) is another GAM179 target gene, herein designated TARGET GENE. MCP BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MCP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MCP BINDING SITE, designated SEQ ID:17253, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26991] Another function of GAM179 is therefore inhibition of Membrane cofactor protein (cd46, trophoblast-lympho-

cyte cross-reactive antigen) (MCP, Accession NP_758867.1), a gene which may be involved in the regulation of complement activation. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCP.

[26992] The function of MCP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_758860.1) is another GAM179 target gene, herein designated TARGET GENE. MCP BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MCP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MCP BINDING SITE, designated SEQ ID:17253, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26993] Another function of GAM179 is therefore inhibition of Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession

NP_758860.1), a gene which may be involved in the regulation of complement activation. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCP.

[26994] The function of MCP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_758871.1) is another GAM179 target gene, herein designated TARGET GENE. MCP BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MCP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MCP BINDING SITE, designated SEQ ID:17253, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26995] Another function of GAM179 is therefore inhibition of Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_758871.1), a gene which may be involved in the regu-

lation of complement activation. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCP.

[26996] The function of MCP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_758870.1) is another GAM179 target gene, herein designated TARGET GENE. MCP BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MCP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MCP BINDING SITE, designated SEQ ID:17253, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26997] Another function of GAM179 is therefore inhibition of Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_758870.1), a gene which may be involved in the regulation of complement activation. Accordingly, utilities of

GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCP.

[26998] The function of MCP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_758864.1) is another GAM179 target gene, herein designated TARGET GENE. MCP BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MCP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MCP BINDING SITE, designated SEQ ID:17253, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[26999] Another function of GAM179 is therefore inhibition of Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_758864.1), a gene which may be involved in the regulation of complement activation. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with MCP.

[27000] The function of MCP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_758861.1) is another GAM179 target gene, herein designated TARGET GENE. MCP BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MCP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MCP BINDING SITE, designated SEQ ID:17253, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27001] Another function of GAM179 is therefore inhibition of Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_758861.1), a gene which may be involved in the regulation of complement activation. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCP.

[27002] The function of MCP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_758863.1) is another GAM179 target gene, herein designated TARGET GENE. MCP BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MCP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MCP BINDING SITE, designated SEQ ID:17253, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27003] Another function of GAM179 is therefore inhibition of Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_758863.1), a gene which may be involved in the regulation of complement activation. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCP.

[27004] The function of MCP and its association with various dis-

eases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_758862.1) is another GAM179 target gene, herein designated TARGET GENE. MCP BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MCP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MCP BINDING SITE, designated SEQ ID:17253, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27005] Another function of GAM179 is therefore inhibition of Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_758862.1), a gene which may be involved in the regulation of complement activation. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCP.

[27006] The function of MCP and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to GAM63.1.Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_002380.3) is another GAM179 target gene, herein designated TARGET GENE. MCP BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MCP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MCP BINDING SITE, designated SEQ ID:17253, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27007] Another function of GAM179 is therefore inhibition of Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_002380.3), a gene which may be involved in the regulation of complement activation. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCP.

[27008] The function of MCP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to GAM63.1.Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_758869.1) is another GAM179 target gene, herein designated TARGET GENE. MCP BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MCP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MCP BINDING SITE, designated SEQ ID:17253, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27009] Another function of GAM179 is therefore inhibition of Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_758869.1), a gene which may be involved in the regulation of complement activation. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCP.

[27010] The function of MCP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.MGC10986 (Accession NP_085053.1) is an-

other GAM179 target gene, herein designated TARGET GENE. MGC10986 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC10986, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC10986 BINDING SITE, designated SEQ ID:4521, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27011] Another function of GAM179 is therefore inhibition of MGC10986 (Accession NP_085053.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10986.

[27012] MGC21874 (Accession XP_291105.1) is another GAM179 target gene, herein designated TARGET GENE. MGC21874 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC21874, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC21874 BINDING SITE, designated SEQ ID:2320, to the

nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27013] Another function of GAM179 is therefore inhibition of MGC21874 (Accession XP_291105.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC21874.

[27014] MGC26733 (Accession NP_659429.2) is another GAM179 target gene, herein designated TARGET GENE. MGC26733 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC26733, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC26733 BINDING SITE, designated SEQ ID:16246, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27015] Another function of GAM179 is therefore inhibition of MGC26733 (Accession NP_659429.2) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC26733.

[27016] MGC33371 (Accession NP_653265.1) is another GAM179

target gene, herein designated TARGET GENE. MGC33371 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC33371, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC33371 BINDING SITE, designated SEQ ID:12923, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27017] Another function of GAM179 is therefore inhibition of MGC33371 (Accession NP_653265.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC33371.

[27018] Molybdenum cofactor synthesis 2 (MOCS2, Accession NP_004522.1) is another GAM179 target gene, herein designated TARGET GENE. MOCS2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MOCS2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MOCS2 BINDING SITE, designated SEQ ID:19765, to the

nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27019] Another function of GAM179 is therefore inhibition of Molybdenum cofactor synthesis 2 (MOCS2, Accession NP_004522.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOCS2.

[27020] Membrane-spanning 4-domains, subfamily a, member 4 (MS4A4A, Accession NP_683876.1) is another GAM179 target gene, herein designated TARGET GENE. MS4A4A BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MS4A4A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MS4A4A BINDING SITE, designated SEQ ID:19413, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27021] Another function of GAM179 is therefore inhibition of Membrane-spanning 4-domains, subfamily a, member 4 (MS4A4A, Accession NP_683876.1), a gene which binds to the fc region of immunoglobulins epsilon. high affinity re-

ceptor. initiating the allergic response. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MS4A4A.

[27022] The function of MS4A4A has been established by previous studies. By EST database searching for homologs of CD20 (MS4A1; 112210), Ishibashi et al. (2001) isolated a cDNA encoding MS4A4A, which they called MS4A4. The deduced 205- amino acid protein has a conserved phosphorylation site at the intracellular loop. Northern blot analysis revealed weak expression in mouse colon and intestine but detected no expression in human tissues. Liang and Tedder (2001) also obtained a cDNA encoding MS4A4A. The predicted 220- amino acid protein is more than 40% identical to its mouse homologs. PCR analysis detected variable expression of MS4A4A in cDNA from multiple hemopoietic cell lines.

[27023]

[27024] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27025] Ishibashi, K.; Suzuki, M.; Sasaki, S.; Imai, M. : Identification of a new multigene four- transmembrane family

(MS4A) related to CD20, HTm4 and beta subunit of the high- affinity IgE receptor. Gene 264: 87- 93, 2001. ; and

[27026] Liang, Y.; Tedder, T. F. : Identification of a CD20-, Fc- epsilon- RI- beta- related gene family: sixteen new MS4A family members expressed in human and mouse. Genomics 72: 119- 127, 2001.

[27027] Further studies establishing the function and utilities of MS4A4A are found in John Hopkins OMIM database record ID 606547, and in cited publications listed in Table 5, which are hereby incorporated by reference.Membrane-spanning 4-domains, subfamily a, member 4 (MS4A4A, Accession NP_076926.2) is another GAM179 target gene, herein designated TARGET GENE. MS4A4A BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MS4A4A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MS4A4A BINDING SITE, designated SEQ ID:19413, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27028] Another function of GAM179 is therefore inhibition of

Membrane-spanning 4-domains, subfamily a, member 4 (MS4A4A, Accession NP_076926.2), a gene which binds to the fc region of immunoglobulins epsilon. high affinity receptor. initiating the allergic response. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MS4A4A.

[27029] The function of MS4A4A has been established by previous studies. By EST database searching for homologs of CD20 (MS4A1; 112210), Ishibashi et al. (2001) isolated a cDNA encoding MS4A4A, which they called MS4A4. The deduced 205- amino acid protein has a conserved phosphorylation site at the intracellular loop. Northern blot analysis revealed weak expression in mouse colon and intestine but detected no expression in human tissues. Liang and Tedder (2001) also obtained a cDNA encoding MS4A4A. The predicted 220- amino acid protein is more than 40% identical to its mouse homologs. PCR analysis detected variable expression of MS4A4A in cDNA from multiple hemopoietic cell lines.

[27030]

[27031] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[27032] Ishibashi, K.; Suzuki, M.; Sasaki, S.; Imai, M. : Identification of a new multigene four- transmembrane family (MS4A) related to CD20, HTm4 and beta subunit of the high- affinity IgE receptor. Gene 264: 87- 93, 2001. ; and

[27033] Liang, Y.; Tedder, T. F. : Identification of a CD20-, Fc- epsilon- RI- beta- related gene family: sixteen new MS4A family members expressed in human and mouse. Genomics 72: 119- 127, 2001.

[27034] Further studies establishing the function and utilities of MS4A4A are found in John Hopkins OMIM database record ID 606547, and in cited publications listed in Table 5, which are hereby incorporated by reference.MTH2 (Accession NP_060753.1) is another GAM179 target gene, herein designated TARGET GENE. MTH2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MTH2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MTH2 BINDING SITE, designated SEQ ID:19548, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27035] Another function of GAM179 is therefore inhibition of MTH2 (Accession NP_060753.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTH2.

[27036] Myosin ie (MYO1E, Accession NP_004989.1) is another GAM179 target gene, herein designated TARGET GENE. MYO1E BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MYO1E, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MYO1E BINDING SITE, designated SEQ ID:3663, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27037] Another function of GAM179 is therefore inhibition of Myosin ie (MYO1E, Accession NP_004989.1), a gene which is an unconventional myosin. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYO1E.

[27038] The function of MYO1E has been established by previous studies. Bement et al. (1994) cloned a human unconventional myosin gene, MYO1E, encoding a predicted 127-kD polypeptide of 1,109 amino acids. The gene, which

they designated myosin IC, contains a characteristic N- terminal myosin head, a single 'IQ motif' predicted to bind a single myosin light chain, and a C- terminal tail with a putative membrane- binding site. They also noted the presence of a C- terminal src- homology domain, reminiscent of 'long- tailed' myosins I from amoeboid organisms. By Northern analysis, Bement et al. (1994) detected ubiquitous expression of MYO1E. Hasson et al. (1996) used fluorescence in situ hybridization to map the loci for 4 unconventional myosin loci in humans: MYO1E (formerly MYO1C), MYO1A (OMIM Ref. No. 601478), MYO1F (OMIM Ref. No. 601480), and MYO10 (OMIM Ref. No. 601481). The MYO1E gene was found to be located on 15q21- q22 in the precise location predicted from its location on chromosome 9 of the mouse.

[27039]

[27040] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27041] Bement, W. M.; Wirth, J. A.; Mooseker, M. S. : Cloning and mRNA expression of human unconventional myosin- IC: a homologue of amoeboid myosins- I with a single IQ motif and an SH3 domain. J. Molec. Biol. 243: 356- 363, 1994. ;

and

[27042] Hasson, T.; Skowron, J. F.; Gilbert, D. J.; Avraham, K. B.; Perry, W. L.; Bement, W. M.; Anderson, B. L.; Sherr, E. H.; Chen, Z.- Y.; Greene, L. A.; Ward, D. C.; Corey, D. P.; Mooseker.

[27043] Further studies establishing the function and utilities of MYO1E are found in John Hopkins OMIM database record ID 601479, and in cited publications listed in Table 5, which are hereby incorporated by reference.Nuclear receptor coactivator 1 (NCOA1, Accession NP_671756.1) is another GAM179 target gene, herein designated TARGET GENE. NCOA1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by NCOA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NCOA1 BINDING SITE, designated SEQ ID:13930, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27044] Another function of GAM179 is therefore inhibition of Nuclear receptor coactivator 1 (NCOA1, Accession NP_671756.1), a gene which acts as a transcriptional

coactivator for steroid and nuclear hormone receptors. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA1.

[27045] The function of NCOA1 has been established by previous studies. Onate et al. (1995) identified steroid receptor coactivator- 1 (SRC1), a coactivator that is required for full transcriptional activity of the steroid receptor superfamily. They isolated a cDNA encoding SRC1 using the yeast 2-hybrid system to identify proteins that interact with the human progesterone receptor (PGR; 607311). The SRC1 protein has a glutamine- rich region and a serine/threonine- rich region. SRC1 enhances the transcriptional activity of ligand- bound PGR but does not alter the basal activity of the target promoter. SRC1 also enhances estrogen receptor (ESR; 133430), glucocorticoid receptor (GRL; 138040), thyroid hormone receptor (e.g., 190120), and retinoid X receptor (e.g., RXRA; 180245) transcriptional activities through their cognate DNA response elements in the presence of hormone. Studies of the effects of SRC1 on unrelated transactivators showed that SRC1 can enhance the transcriptional activities of SP1 (OMIM Ref. No. 189906) and the chimeric Gal4- VP16 protein, but not

those of E2F (e.g., 189971), E47 (OMIM Ref. No. 147141), or CREB (OMIM Ref. No. 123810). Coexpression of SRC1 with PGR and ESR reversed the ability of ESR to squelch activation by PGR, suggesting that SRC1 is a limiting factor necessary for efficient PGR and ESR transactivation. A C- terminal form of SRC1 containing the receptor- binding region acted as a dominant- negative repressor of endogenous SRC1 function. SRC1 is expressed as 2 mRNAs of approximately 5.5 and 7.5 kb in a variety of human tissues and cell lines. Using a far- Western- based approach to screen a HeLa cell cDNA expression library with bacterially expressed rat thyroid hormone receptor (THRB; 190160), Takeshita et al. (1996) identified a partial SRC1 cDNA. They isolated the remaining sequence by 5- prime RACE. The full- length cDNA encodes a 1,440- amino acid protein with a mass of approximately 160 kD. In vitro binding studies showed that SRC1 can bind to TBP (OMIM Ref. No. 600075) and to TFIIB (OMIM Ref. No. 189963), in addition to a variety of nuclear hormone receptors in a ligand- dependent manner, suggesting that SRC1 may play a role as a bridging molecule between nuclear hormone receptors and general transcription factors. The conserved AF- 2 region of nuclear hormone receptors was

not required for receptor- SRC1 binding

[27046]

[27047] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27048] Onate, S. A.; Tsai, S. Y.; Tsai, M.- J.; O'Malley, B. W. : Sequence and characterization of a coactivator for the steroid hormone receptor superfamily. Science 270: 1354- 1357, 1995. ; and

[27050] Further studies establishing the function and utilities of NCOA1 are found in John Hopkins OMIM database record ID 602691, and in cited publications listed in Table 5, which are hereby incorporated by reference.NESG1 (Accession NP_036469.1) is another GAM179 target gene, herein designated TARGET GENE. NESG1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NESG1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementar-

ity of the nucleotide sequences of NESG1 BINDING SITE, designated SEQ ID:3220, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27051] Another function of GAM179 is therefore inhibition of NESG1 (Accession NP_036469.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NESG1.

[27052] NLG1 (Accession NP_115499.1) is another GAM179 target gene, herein designated TARGET GENE. NLG1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NLG1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NLG1 BINDING SITE, designated SEQ ID:19329, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27053] Another function of GAM179 is therefore inhibition of NLG1 (Accession NP_115499.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NLG1.

[27054] Phosphoinositide-3-kinase, regulatory subunit, polypep-

tide 3 (p55, gamma) (PIK3R3, Accession NP_003620.1) is another GAM179 target gene, herein designated TARGET GENE. PIK3R3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PIK3R3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PIK3R3 BINDING SITE, designated SEQ ID:16643, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27055] Another function of GAM179 is therefore inhibition of Phosphoinositide-3-kinase, regulatory subunit, polypeptide 3 (p55, gamma) (PIK3R3, Accession NP_003620.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3R3.

[27056] PILRB (Accession NP_038468.3) is another GAM179 target gene, herein designated TARGET GENE. PILRB BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PILRB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4

illustrates the complementarity of the nucleotide sequences of PILRB BINDING SITE, designated SEQ ID:17335, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27057] Another function of GAM179 is therefore inhibition of PILRB (Accession NP_038468.3) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PILRB.

[27058] PILRB (Accession NP_839956.1) is another GAM179 target gene, herein designated TARGET GENE. PILRB BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PILRB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PILRB BINDING SITE, designated SEQ ID:17335, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27059] Another function of GAM179 is therefore inhibition of PILRB (Accession NP_839956.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PILRB.

[27060] PILRB (Accession NP_778212.2) is another GAM179 target

gene, herein designated TARGET GENE. PILRB BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PILRB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PILRB BINDING SITE, designated SEQ ID:17335, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27061] Another function of GAM179 is therefore inhibition of PILRB (Accession NP_778212.2) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PILRB.

[27062] Phosphatidylinositol-4-phosphate 5-kinase, type i, beta (PIP5K1B, Accession NP_003549.1) is another GAM179 target gene, herein designated TARGET GENE. PIP5K1B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PIP5K1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PIP5K1B BINDING SITE, designated SEQ ID:11230, to the nucleotide sequence of GAM179 RNA, herein designated

GAM RNA, also designated SEQ ID:300.

[27063] Another function of GAM179 is therefore inhibition of Phosphatidylinositol-4-phosphate 5-kinase, type i, beta (PIP5K1B, Accession NP_003549.1), a gene which catalyses the phosphorylation of phosphatidylinositol- 4- phosphate to form phosphatidylinositol- 4,5- biphosphate . and therefore may be associated with Friedreich ataxia. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of Friedreich ataxia., and of other diseases and clinical conditions associated with PIP5K1B.

[27064] The function of PIP5K1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM94.1.Plexin c1 (PLXNC1, Accession NP_005752.1) is another GAM179 target gene, herein designated TARGET GENE. PLXNC1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PLXNC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PLXNC1 BINDING SITE, designated SEQ ID:17920, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ

ID:300.

[27065] Another function of GAM179 is therefore inhibition of Plexin c1 (PLXNC1, Accession NP_005752.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLXNC1.

[27066] PP1628 (Accession NP_079477.1) is another GAM179 target gene, herein designated TARGET GENE. PP1628 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PP1628, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PP1628 BINDING SITE, designated SEQ ID:5602, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27067] Another function of GAM179 is therefore inhibition of PP1628 (Accession NP_079477.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP1628.

[27068] Palmitoyl-protein thioesterase 2 (PPT2, Accession NP_619731.1) is another GAM179 target gene, herein designated TARGET GENE. PPT2 BINDING SITE is a target

binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PPT2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPT2 BINDING SITE, designated SEQ ID:5462, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27069] Another function of GAM179 is therefore inhibition of Palmitoyl-protein thioesterase 2 (PPT2, Accession NP_619731.1), a gene which is a palmitoyl- protein thioesterase 2 which possesses a different substrate specificity than PPT1. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPT2.

[27070] The function of PPT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Palmitoyl-protein thioesterase 2 (PPT2, Accession NP_005146.3) is another GAM179 target gene, herein designated TARGET GENE. PPT2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PPT2, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPT2 BINDING SITE, designated SEQ ID:5462, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27071] Another function of GAM179 is therefore inhibition of Palmitoyl-protein thioesterase 2 (PPT2, Accession NP_005146.3), a gene which is a palmitoyl- protein thioesterase 2 which possesses a different substrate specificity than PPT1. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPT2.

[27072] The function of PPT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Proline-rich protein bstni subfamily 3 (PRB3, Accession NP_006240.2) is another GAM179 target gene, herein designated TARGET GENE. PRB3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PRB3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementar-

ity of the nucleotide sequences of PRB3 BINDING SITE, designated SEQ ID:6636, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27073] Another function of GAM179 is therefore inhibition of Proline-rich protein bstni subfamily 3 (PRB3, Accession NP_006240.2), a gene which is a salivary proline- rich protein and subunit of the splicing factor sf3a. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRB3.

[27074] The function of PRB3 has been established by previous studies. Azen et al. (1978) found 5 alleles. Linkage with Pr, Db, and Pa was indicated by linkage disequilibrium. These genes presumably arose by gene duplication, in view of the structural similarity of the gene products. They play an important role in inhibiting calcium phosphate precipitation from saliva and the glycoprotein forms part of the acquired dental pellicle and plaque. On the basis of relative degrees of linkage disequilibrium, Azen and Denniston (1980) favored positioning of G1 'outside' Db, to give suggested gene order Pa- Pr- Db- G1. Ikemoto et al. (1979) delineated a polymorphic salivary glycoprotein they

symbolized Ph (salivary parotid heavy protein). The relation to G1 of Azen et al. (1978) was not known. According to the hypothesis of Maeda (1985), as outlined in 168730, 6 loci constituting 2 gene subfamilies code the salivary proline- rich proteins. One subfamily, with 2 genes, codes the acidic proteins; the genes are rich in HaeIII restriction sites and are designated PRH1 and PRH2. The other subfamily, with 4 loci, codes the basic proteins; the genes are rich in BstNI restriction sites and are designated PRB1, PRB2, PRB3, and PRB4. Maeda (1985) concluded that the gene she designated PRB3 probably codes G1. Which ones of the other basic proline- rich proteins are coded by PRB1, 2 and 4 is not yet certain. Sequencing and restriction mapping indicate that the PRP cluster is in a segment of DNA about 500 kb long (Maeda, 1985). There is no information on the order and linkage relationships of the 6 genes. The 2 genes PRH1 (OMIM Ref. No. 168730) and PRH2 (OMIM Ref. No. 168790) have been completely sequenced (Kim and Maeda, 1986). The sequence information confirms the allelic relationship of Db, Pa, and PIF.

[27075]

[27076] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[27077] Kim, H.- S.; Maeda, N. : Structures of two HaeIII- type genes in the human salivary proline- rich protein multigene family. J. Biol. Chem. 261: 6712- 6718, 1986. ; and

[27078] Maeda, N. : Inheritance of the human salivary proline- rich proteins: a reinterpretation in terms of six loci forming two subfamilies. Biochem. Genet. 23: 455- 464, 1985.

[27079] Further studies establishing the function and utilities of PRB3 are found in John Hopkins OMIM database record ID 168840, and in cited publications listed in Table 5, which are hereby incorporated by reference.PRO0461 (Accession NP_112558.1) is another GAM179 target gene, herein designated TARGET GENE. PRO0461 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PRO0461, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO0461 BINDING SITE, designated SEQ ID:14706, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27080] Another function of GAM179 is therefore inhibition of PRO0461 (Accession NP_112558.1) . Accordingly, utilities

of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0461.

[27081] Rab5c, member ras oncogene family (RAB5C, Accession NP_004574.1) is another GAM179 target gene, herein designated TARGET GENE. RAB5C BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by RAB5C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAB5C BINDING SITE, designated SEQ ID:590, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27082] Another function of GAM179 is therefore inhibition of Rab5c, member ras oncogene family (RAB5C, Accession NP_004574.1), a gene which is involved in the process of docking and/or fusion of vesicles with their correct acceptor compartment. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB5C.

[27083] The function of RAB5C has been established by previous studies. Members of the Rab protein family are small GTPases of the Ras superfamily that are thought to ensure fi-

delity in the process of docking and/or fusion of vesicles with their correct acceptor compartment. Han et al. (1996) isolated fetal lung cDNAs encoding a RAB protein that they designated RABL (RAB5- like). The predicted 216-amino acid RABL protein shares 86% identity with RAB5A (OMIM Ref. No. 179512) and RAB5B (OMIM Ref. No. 179514) and contains the conserved GTP- binding site characteristic of RAS proteins. RT- PCR analysis revealed that RABL is expressed ubiquitously. By analysis of cloned segments, Albertsen et al. (1994) determined that the RABL gene, which they called BC1- 16, is located in the BRCA1 (OMIM Ref. No. 113705) gene region on chromosome 17q12- q21. Han et al. (1996) refined the map position to 17q21.2 using FISH.

[27084]

[27085] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27086] Albertsen, H. M.; Smith, S. A.; Mazoyer, S.; Fujimoto, E.; Stevens, J.; Williams, B.; Rodriguez, P.; Cropp, C. S.; Slijepcevic, P.; Carlson, M.; Robertson, M.; Bradley, P.; and 9 others : A physical map and candidate genes in the BRCA1 region on chromosome 17q12- 21. Nature Genet. 7: 472-

479, 1994. ; and

[27087] Han, H.- J.; Sudo, K.; Inazawa, J.; Nakamura, Y. : Isolation and mapping of a human gene (RABL) encoding a small GTP- binding protein homologous to the Ras- related RAB gene. Cytogenet. Cel.

[27088] Further studies establishing the function and utilities of RAB5C are found in John Hopkins OMIM database record ID 604037, and in cited publications listed in Table 5, which are hereby incorporated by reference.Rad9 homolog (s. pombe) (RAD9, Accession NP_004575.1) is another GAM179 target gene, herein designated TARGET GENE. RAD9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAD9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAD9 BINDING SITE, designated SEQ ID:16284, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27089] Another function of GAM179 is therefore inhibition of Rad9 homolog (s. pombe) (RAD9, Accession NP_004575.1), a gene which may function as a cell cycle checkpoint protein. Accordingly, utilities of GAM179 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD9.

[27090] The function of RAD9 has been established by previous studies. In S. pombe, rad9 is one of 6 genes essential for both the incomplete DNA replication (S- M) and DNA damage checkpoints. See HUS1 (OMIM Ref. No. 603760). By searching an EST database, Lieberman et al. (1996) identified a partial cDNA encoding HRAD9, a human rad9 homolog. The authors used the partial cDNA to recover additional human RAD9 cDNAs corresponding to the entire coding region. The predicted 391- amino acid human protein is 25% identical to S. pombe rad9. The human RAD9 gene partially complemented the hydroxyurea sensitivity, radiosensitivity, and checkpoint defects of rad9-null mutant cells. On immunoblots of mammalian cell extracts, Volkmer and Karnitz (1999) found that human RAD9 migrated at 70 kD, even though it has a predicted molecular mass of 45 kD. The authors attributed this discrepancy to complex posttranslational modifications. In vivo, the human RAD9 protein was phosphorylated in response to DNA damage, suggesting that it participates in a DNA damage- inducible signaling pathway. Immunoprecipitation studies demonstrated that the fully modified

form of RAD9 interacts selectively with RAD1 (OMIM Ref. No. 603153) and HUS1 in a stable complex. Volkmer and Karnitz (1999) concluded that these 3 proteins are central components of a DNA damage- responsive protein complex in human cells.

[27091]

[27092] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27093] Lieberman, H. B.; Hopkins, K. M.; Nass, M.; Demetrick, D.; Davey, S. : A human homolog of the Schizosaccharomyces pombe rad9+ checkpoint control gene. Proc. Nat. Acad. Sci. 93: 13890- 13895, 1996. ; and

[27094] Volkmer, E.; Karnitz, L. M. : Human homologs of Schizosaccharomyces pombe Rad1, Hus1, and Rad9 form a DNA damage- responsive protein complex. J. Biol. Chem. 274: 567- 570, 1999.

[27095] Further studies establishing the function and utilities of RAD9 are found in John Hopkins OMIM database record ID 603761, and in cited publications listed in Table 5, which are hereby incorporated by reference.Retinoblastoma binding protein 2 (RBBP2, Accession NP_005047.1) is another GAM179 target gene, herein designated TARGET

GENE. RBBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RBBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RBBP2 BINDING SITE, designated SEQ ID:19420, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27096] Another function of GAM179 is therefore inhibition of Retinoblastoma binding protein 2 (RBBP2, Accession NP_005047.1), a gene which interacts with the vital protein- binding domain of the retinoblastoma protein. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBBP2.

[27097] The function of RBBP2 has been established by previous studies. Baens et al. (1995) characterized 117 cDNAs isolated by direct cDNA selection using pools of human chromosome 12p cosmids. Of these, 3 matched previously determined cDNA sequences, including the retinoblastoma- binding protein- 2 (RBBP2) gene. STSs were developed for all cosmids. Regional assignment of the STSs by PCR analysis with somatic cell hybrids and

fluorescence in situ hybridization showed that the loci mapped to 12p11. To identify proteins that may modulate the activity of RBTN2 (LMO2; 180385), Mao et al. (1997) employed the yeast 2- hybrid assay to screen a human lymphocyte cDNA library using the RBTN2 LIM domain region as bait. They isolated a cDNA encoding the C- terminal region of RBBP2. The authors confirmed the interaction between RBTN2 and RBBP2 using in vitro binding assays and by coimmunoprecipitation of the 2 proteins. Deletion analysis showed that the second LIM domain of RBTN2 was necessary and sufficient for binding to the last 69 amino acids of RBBP2. The interaction between RBTN2 and RBBP2 had a functional consequence: the combination of RBBP2 and RBTN2 resulted in a higher level of transcription than RBTN2 alone in an in vitro assay. Mao et al. (1997) stated that the interaction of RBTN2 with RBBP2 suggests that RBTN2 may directly affect the activity of RBBP2 and/or RBTN2 may indirectly modulate the functions of the retinoblastoma protein (RB1; 180200) by binding to RBBP2.

[27098]

[27099] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[27100] Baens, M.; Aerssens, J.; Van Zand, K.; Van den Berghe, H.; Marynen, P. : Isolation and regional assignment of human chromosome 12p cDNAs. Genomics 29: 44- 52, 1995. ; and

[27102] Further studies establishing the function and utilities of RBBP2 are found in John Hopkins OMIM database record ID 180202, and in cited publications listed in Table 5, which are hereby incorporated by reference.Regenerating islet-derived-like, pancreatic stone protein-like, pancreatic thread protein-like (rat) (REGL, Accession NP_006499.1) is another GAM179 target gene, herein designated TARGET GENE. REGL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by REGL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of REGL BINDING SITE, designated SEQ ID:12552, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ

ID:300.

[27103] Another function of GAM179 is therefore inhibition of Regenerating islet-derived-like, pancreatic stone protein-like, pancreatic thread protein-like (rat) (REGL, Accession NP_006499.1), a gene which is a member of REG family with unknown function. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with REGL.

[27104] The function of REGL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.SAE1 (Accession NP_005491.1) is another GAM179 target gene, herein designated TARGET GENE. SAE1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SAE1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SAE1 BINDING SITE, designated SEQ ID:17602, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27105] Another function of GAM179 is therefore inhibition of SAE1 (Accession NP_005491.1) . Accordingly, utilities of

GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SAE1.

[27106] Sh3-domain binding protein 1 (SH3BP1, Accession NP_061830.2) is another GAM179 target gene, herein designated TARGET GENE. SH3BP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SH3BP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SH3BP1 BINDING SITE, designated SEQ ID:14730, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27107] Another function of GAM179 is therefore inhibition of Sh3-domain binding protein 1 (SH3BP1, Accession NP_061830.2) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BP1.

[27108] Sialyltransferase 1 (beta-galactoside alpha-2,6-sialytransferase) (SIAT1, Accession NP_775323.1) is another GAM179 target gene, herein designated TARGET GENE. SIAT1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of

mRNA encoded by SIAT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIAT1 BINDING SITE, designated SEQ ID:10204, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27109] Another function of GAM179 is therefore inhibition of Sialyltransferase 1 (beta-galactoside alpha-2,6-sialytransferase) (SIAT1, Accession NP_775323.1), a gene which transfers sialic acid from the donor of substrate cmp- sialic acid to galactose containing acceptor substrates. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT1.

[27110] The function of SIAT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.2.Sialyltransferase 1 (beta-galactoside alpha-2,6-sialytransferase) (SIAT1, Accession NP_003023.1) is another GAM179 target gene, herein designated TARGET GENE. SIAT1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of

mRNA encoded by SIAT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIAT1 BINDING SITE, designated SEQ ID:10204, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27111] Another function of GAM179 is therefore inhibition of Sialyltransferase 1 (beta-galactoside alpha-2,6-sialytransferase) (SIAT1, Accession NP_003023.1), a gene which transfers sialic acid from the donor of substrate cmp- sialic acid to galactose containing acceptor substrates. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT1.

[27112] The function of SIAT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.2.Sialyltransferase 1 (beta-galactoside alpha-2,6-sialytransferase) (SIAT1, Accession NP_775324.1) is another GAM179 target gene, herein designated TARGET GENE. SIAT1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of

mRNA encoded by SIAT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIAT1 BINDING SITE, designated SEQ ID:10204, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27113] Another function of GAM179 is therefore inhibition of Sialyltransferase 1 (beta-galactoside alpha-2,6-sialytransferase) (SIAT1, Accession NP_775324.1), a gene which transfers sialic acid from the donor of substrate cmp- sialic acid to galactose containing acceptor substrates. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT1.

[27114] The function of SIAT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.2.Solute carrier family 12 (potassium/chloride transporters), member 7 (SLC12A7, Accession NP_006589.1) is another GAM179 target gene, herein designated TARGET GENE. SLC12A7 BINDING SITE is a target binding site found in the 3` untranslated region of

mRNA encoded by SLC12A7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC12A7 BINDING SITE, designated SEQ ID:15230, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27115] Another function of GAM179 is therefore inhibition of Solute carrier family 12 (potassium/chloride transporters), member 7 (SLC12A7, Accession NP_006589.1), a gene which is a potassium/chloride- cotransporter. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC12A7.

[27116] The function of SLC12A7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM105.1.SLC37A3 (Accession NP_115671.1) is another GAM179 target gene, herein designated TARGET GENE. SLC37A3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC37A3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of

Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC37A3 BINDING SITE, designated SEQ ID:14888, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27117] Another function of GAM179 is therefore inhibition of SLC37A3 (Accession NP_115671.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC37A3.

[27118] Smcx homolog, x chromosome (mouse) (SMCX, Accession NP_004178.1) is another GAM179 target gene, herein designated TARGET GENE. SMCX BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SMCX, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SMCX BINDING SITE, designated SEQ ID:8263, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27119] Another function of GAM179 is therefore inhibition of Smcx homolog, x chromosome (mouse) (SMCX, Accession NP_004178.1), a gene which escapes X inactivation. Ac-

cordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMCX.

[27120] The function of SMCX and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Spondin 1, (f-spondin) extracellular matrix protein (SPON1, Accession NP_006099.1) is another GAM179 target gene, herein designated TARGET GENE. SPON1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SPON1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SPON1 BINDING SITE, designated SEQ ID:16909, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27121] Another function of GAM179 is therefore inhibition of Spondin 1, (f-spondin) extracellular matrix protein (SPON1, Accession NP_006099.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPON1.

[27122] Serine palmitoyltransferase, long chain base subunit 2

(SPTLC2, Accession NP_004854.1) is another GAM179 target gene, herein designated TARGET GENE. SPTLC2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SPTLC2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SPTLC2 BINDING SITE, designated SEQ ID:16724, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27123] Another function of GAM179 is therefore inhibition of Serine palmitoyltransferase, long chain base subunit 2 (SPTLC2, Accession NP_004854.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPTLC2.

[27124] Stromal antigen 3 (STAG3, Accession NP_076975.1) is another GAM179 target gene, herein designated TARGET GENE. STAG3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by STAG3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of STAG3 BINDING SITE, designated SEQ ID:5382, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27125] Another function of GAM179 is therefore inhibition of Stromal antigen 3 (STAG3, Accession NP_076975.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAG3.

[27126] Synaptotagmin-like 2 (SYTL2, Accession NP_116561.1) is another GAM179 target gene, herein designated TARGET GENE. SYTL2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by SYTL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SYTL2 BINDING SITE, designated SEQ ID:7702, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27127] Another function of GAM179 is therefore inhibition of Synaptotagmin-like 2 (SYTL2, Accession NP_116561.1) . Accordingly, utilities of GAM179 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with SYTL2.

[27128] Tenascin r (restrictin, janusin) (TNR, Accession NP_003276.2) is another GAM179 target gene, herein designated TARGET GENE. TNR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TNR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TNR BINDING SITE, designated SEQ ID:19266, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27129] Another function of GAM179 is therefore inhibition of Tenascin r (restrictin, janusin) (TNR, Accession NP_003276.2), a gene which has a role in axonal path finding during embryonic development. Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNR.

[27130] The function of TNR has been established by previous studies. The tenascin (TN) gene family includes at least 3 genes in mammals: TN- C (or hexabrachion; 187380),

TN- X (TNXA; 600261), and TN- R (Erickson, 1993). The genes are expressed in distinct tissues at different times during embyronic development and are present in adult tissues. Carnemolla et al. (1996) and Leprini et al. (1996) stated that TN- R has been detected predominantly in the central nervous system and is localized around motor neurons and on motor axons in the spinal cord, cerebellum, hippocampus, and olfactory bulb. It is detectable at embryonic days 6 to 16, but is barely detectable in the adult. This time- restricted distribution suggests an involvement of TN- R in central nervous system development Erickson (1997) provided a diagram of the individual members of the tenascin family, including TN- Y, a new member discovered in chicken. Each tenascin subunit has an N- terminal segment that connects into trimers or hexamers, a series of EGF domains, a series of FN- III domains, and a fibrinogen- like domain at the C terminus; see Figure 1 of Erickson (1997).

[27131]

[27132] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27133] Carnemolla, B.; Leprini, A.; Borsi, L.; Querze, G.; Urbini, S.;

Zardi, L. : Human tenascin- R: complete primary structure, pre- mRNA alternative splicing and gene localization on chromosome 1q23- q24. J. Biol. Chem. 271: 8157- 8160, 1996. ; and

[27134] Erickson, H. P. : A tenascin knockout with a phenotype. Nature Genet. 17: 5- 7, 1997.

[27135] Further studies establishing the function and utilities of TNR are found in John Hopkins OMIM database record ID 601995, and in cited publications listed in Table 5, which are hereby incorporated by reference.Tyro protein tyrosine kinase binding protein (TYROBP, Accession NP_003323.1) is another GAM179 target gene, herein designated TARGET GENE. TYROBP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TYROBP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TYROBP BINDING SITE, designated SEQ ID:12609, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27136] Another function of GAM179 is therefore inhibition of Tyro protein tyrosine kinase binding protein (TYROBP, Ac-

cession NP_003323.1) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TYROBP.

[27137] Upstream binding protein 1 (lbp-1a) (UBP1, Accession NP_055332.2) is another GAM179 target gene, herein designated TARGET GENE. UBP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by UBP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UBP1 BINDING SITE, designated SEQ ID:17947, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27138] Another function of GAM179 is therefore inhibition of Upstream binding protein 1 (lbp-1a) (UBP1, Accession NP_055332.2) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBP1.

[27139] WBP3 (Accession NP_783863.2) is another GAM179 target gene, herein designated TARGET GENE. WBP3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by WBP3, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WBP3 BINDING SITE, designated SEQ ID:18927, to the nucleotide sequence of GAM179 RNA, herein designated GAM RNA, also designated SEQ ID:300.

[27140] Another function of GAM179 is therefore inhibition of WBP3 (Accession NP_783863.2) . Accordingly, utilities of GAM179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WBP3.

[27141]

[27142] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 180 (GAM180), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27143] GAM180 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM180 was detected is described hereinabove with reference to Figs. 8-15.

[27144] GAM180 gene, herein designated GAM GENE, and GAM180 target gene, herein designated TARGET GENE,

are human genes contained in the human genome.

[27145] GAM180 gene encodes a GAM180 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM180 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM180 precursor RNA is designated SEQ ID:107, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:107 is located at position 128815436 relative to chromosome 11.

[27146] GAM180 precursor RNA folds onto itself, forming GAM180 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27147] GAM180 precursor RNA folds onto itself, forming GAM180 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin struc-

ture`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[27148] Nucleotide sequence of GAM180 precursor RNA, designated SEQ-ID: 107, and a schematic representation of a predicted secondary folding of GAM180 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[27149] An enzyme complex designated DICER COMPLEX, `dices` the GAM180 folded precursor RNA into GAM180 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: B) nucleotide sequence of GAM180 RNA is designated SEQ ID:214, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[27150] GAM180 target gene, herein designated TARGET GENE,

encodes a corresponding messenger RNA, GAM180 target RNA, herein designated GAM TARGET RNA. GAM180 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27151] GAM180 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM180 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM180 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM180 RNA may have a different number of target binding sites in untranslated regions of a GAM180 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27152] The complementary binding of GAM180 RNA, herein designated GAM RNA, to target binding sites on GAM180 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM180 target RNA into GAM180 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27153] It is appreciated that GAM180 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM180 target genes. The mRNA of each one of this plurality of GAM180 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM180 RNA, herein designated GAM RNA, and which when bound by GAM180 RNA causes inhibition of translation of respective one or more GAM180 target proteins.

[27154] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM180 gene, herein designated GAM GENE, on one or more GAM180 target genes, herein collectively designated

TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27155] It is appreciated that specific functions and accordingly utilities of GAM180 correlate with, and may be deduced from, the identity of the target genes which GAM180 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27156]

[27157]

[27158] 3PAP (Accession NP_061934.2) is a GAM180 target gene, herein designated TARGET GENE. 3PAP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by 3PAP, corresponding to a target bind-

ing site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of 3PAP BINDING SITE, designated SEQ ID:9183, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27159] A function of GAM180 is therefore inhibition of 3PAP (Accession NP_061934.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with 3PAP.

[27160] ACK1 (Accession NP_005772.2) is another GAM180 target gene, herein designated TARGET GENE. ACK1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ACK1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ACK1 BINDING SITE, designated SEQ ID:18640, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27161] Another function of GAM180 is therefore inhibition of ACK1 (Accession NP_005772.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with ACK1.

[27162] Acid phosphatase 2, lysosomal (ACP2, Accession NP_001601.1) is another GAM180 target gene, herein designated TARGET GENE. ACP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ACP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ACP2 BINDING SITE, designated SEQ ID:16613, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27163] Another function of GAM180 is therefore inhibition of Acid phosphatase 2, lysosomal (ACP2, Accession NP_001601.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACP2.

[27164] A disintegrin and metalloproteinase domain 8 (ADAM8, Accession NP_001100.1) is another GAM180 target gene, herein designated TARGET GENE. ADAM8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ADAM8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADAM8 BINDING SITE, designated SEQ ID:19901, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27165] Another function of GAM180 is therefore inhibition of A disintegrin and metalloproteinase domain 8 (ADAM8, Accession NP_001100.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM8.

[27166] Adenylate cyclase 5 (ADCY5, Accession XP_171048.2) is another GAM180 target gene, herein designated TARGET GENE. ADCY5 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ADCY5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADCY5 BINDING SITE, designated SEQ ID:9867, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27167] Another function of GAM180 is therefore inhibition of Adenylate cyclase 5 (ADCY5, Accession XP_171048.2) . Accordingly, utilities of GAM180 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with ADCY5.

[27168] A kinase (prka) anchor protein 7 (AKAP7, Accession NP_619539.1) is another GAM180 target gene, herein designated TARGET GENE. AKAP7 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AKAP7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AKAP7 BINDING SITE, designated SEQ ID:662, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27169] Another function of GAM180 is therefore inhibition of A kinase (prka) anchor protein 7 (AKAP7, Accession NP_619539.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP7.

[27170] A kinase (prka) anchor protein 7 (AKAP7, Accession NP_057461.1) is another GAM180 target gene, herein designated TARGET GENE. AKAP7 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AKAP7, correspond-

ing to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AKAP7 BINDING SITE, designated SEQ ID:662, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27171] Another function of GAM180 is therefore inhibition of A kinase (prka) anchor protein 7 (AKAP7, Accession NP_057461.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP7.

[27172] A kinase (prka) anchor protein 7 (AKAP7, Accession NP_004833.1) is another GAM180 target gene, herein designated TARGET GENE. AKAP7 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AKAP7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AKAP7 BINDING SITE, designated SEQ ID:662, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27173] Another function of GAM180 is therefore inhibition of A

kinase (prka) anchor protein 7 (AKAP7, Accession NP_004833.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP7.

[27174] ALK7 (Accession NP_660302.1) is another GAM180 target gene, herein designated TARGET GENE. ALK7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ALK7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ALK7 BINDING SITE, designated SEQ ID:4668, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27175] Another function of GAM180 is therefore inhibition of ALK7 (Accession NP_660302.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALK7.

[27176] ANKFY1 (Accession NP_057460.2) is another GAM180 target gene, herein designated TARGET GENE. ANKFY1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ANKFY1, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ANKFY1 BINDING SITE, designated SEQ ID:13680, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27177] Another function of GAM180 is therefore inhibition of ANKFY1 (Accession NP_057460.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANKFY1.

[27178] AP1S3 (Accession NP_848929.1) is another GAM180 target gene, herein designated TARGET GENE. AP1S3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AP1S3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AP1S3 BINDING SITE, designated SEQ ID:10369, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27179] Another function of GAM180 is therefore inhibition of

AP1S3 (Accession NP_848929.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1S3.

[27180] Ariadne homolog 2 (drosophila) (ARIH2, Accession NP_006312.1) is another GAM180 target gene, herein designated TARGET GENE. ARIH2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ARIH2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARIH2 BINDING SITE, designated SEQ ID:6107, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27181] Another function of GAM180 is therefore inhibition of Ariadne homolog 2 (drosophila) (ARIH2, Accession NP_006312.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARIH2.

[27182] Additional sex combs like 1 (drosophila) (ASXL1, Accession NP_056153.2) is another GAM180 target gene, herein designated TARGET GENE. ASXL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ASXL1, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ASXL1 BINDING SITE, designated SEQ ID:6136, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27183] Another function of GAM180 is therefore inhibition of Additional sex combs like 1 (drosophila) (ASXL1, Accession NP_056153.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASXL1.

[27184] Arginine vasopressin receptor 1b (AVPR1B, Accession NP_000698.1) is another GAM180 target gene, herein designated TARGET GENE. AVPR1B BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by AVPR1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AVPR1B BINDING SITE, designated SEQ ID:10287, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27185] Another function of GAM180 is therefore inhibition of Arginine vasopressin receptor 1b (AVPR1B, Accession

NP_000698.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AVPR1B.

[27186] Btb and cnc homology 1, basic leucine zipper transcription factor 2 (BACH2, Accession NP_068585.1) is another GAM180 target gene, herein designated TARGET GENE. BACH2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BACH2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BACH2 BINDING SITE, designated SEQ ID:9027, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27187] Another function of GAM180 is therefore inhibition of Btb and cnc homology 1, basic leucine zipper transcription factor 2 (BACH2, Accession NP_068585.1), a gene which acts as repressor or activator, binds to maf recognition elements and therefore may be associated with Non-hodgkin lymphoma. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of Non-hodgkin lymphoma, and of other diseases and clinical conditions associated with BACH2.

[27188] The function of BACH2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Blood vessel epicardial substance (BVES, Accession NP_671488.1) is another GAM180 target gene, herein designated TARGET GENE. BVES BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by BVES, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BVES BINDING SITE, designated SEQ ID:12682, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27189] Another function of GAM180 is therefore inhibition of Blood vessel epicardial substance (BVES, Accession NP_671488.1), a gene which plays an important role in vertebrate heart development. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BVES.

[27190] The function of BVES has been established by previous studies. Reese et al. (1999) cloned chick and mouse bves and showed by immunolocalization that bves protein is

expressed in the progenitors of coronary artery smooth muscle cells as well as in differentiated smooth muscle cells. Using a probe obtained by low stringency PCR with mouse bves to screen a human heart cDNA library, Reese and Bader (1999) identified a cDNA for human BVES. BVES encodes a deduced 334- amino acid protein that is 75% identical to the 357- amino acid chick bves. Sequence analysis predicts 3 transmembrane helices with an extracellular C terminus. Northern blot analysis revealed that expression of an approximately 5.5- kb BVES transcript is restricted to skeletal muscle and adult and fetal heart. In an independent search for transcripts preferentially expressed during chick heart development, Andree et al. (2000) isolated chick, mouse, and human BVES, which they called Popeye protein- 1 (POP1). They found that BVES encodes a deduced 41- kD, 359- amino acid protein that shares sequence homology with the Popeye genes POP2 (OMIM Ref. No. 605823) and POP3 (OMIM Ref. No. 605824). By screening heart and total embryo cDNA libraries, Andree et al. (2000) isolated 4 different transcripts of BVES, which differ in their tissue specificity. Using in situ hybridization, they detected BVES expression in the developing heart of both chicken and mouse. After

transfection of BVES into COS- 7 cells, Andree et al. (2000) observed perinuclear distribution of BVES protein and concluded that POP proteins are associated with membranes. Based on the conservation and expression pattern of the 3 Popeye genes in mouse, chicken, and human, Andree et al. (2000) concluded that POP genes play an important role in vertebrate heart development.

[27191]

[27192] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27193] Reese, D. E.; Zavaljevski, M.; Streiff, N. L.; Bader, D. : Bves: a novel gene expressed during coronary blood vessel development. Dev. Biol. 209: 159- 171, 1999. ; and

[27194] Andree, B.; Hillemann, T.; Kessler- Ieckson, G.; Schmitt-John, T.; Jockusch, H.; Arnold, H.- H.; Brand, T. : Isolation and characterization of the novel Popeye gene family expressed in s.

[27195] Further studies establishing the function and utilities of BVES are found in John Hopkins OMIM database record ID 604577, and in cited publications listed in Table 5, which are hereby incorporated by reference.Chromosome 1 open reading frame 16 (C1orf16, Accession NP_055652.2) is

another GAM180 target gene, herein designated TARGET GENE. C1orf16 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by C1orf16, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1orf16 BINDING SITE, designated SEQ ID:9607, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27196] Another function of GAM180 is therefore inhibition of Chromosome 1 open reading frame 16 (C1orf16, Accession NP_055652.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf16.

[27197] Chromosome 1 open reading frame 24 (C1orf24, Accession NP_443198.1) is another GAM180 target gene, herein designated TARGET GENE. C1orf24 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by C1orf24, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1orf24 BINDING SITE, designated SEQ ID:9821, to the

nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27198] Another function of GAM180 is therefore inhibition of Chromosome 1 open reading frame 24 (C1orf24, Accession NP_443198.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf24.

[27199] Chromosome 1 open reading frame 24 (C1orf24, Accession NP_071366.1) is another GAM180 target gene, herein designated TARGET GENE. C1orf24 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by C1orf24, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1orf24 BINDING SITE, designated SEQ ID:9821, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27200] Another function of GAM180 is therefore inhibition of Chromosome 1 open reading frame 24 (C1orf24, Accession NP_071366.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf24.

[27201] Complement component 1, q subcomponent, receptor 1 (C1QR1, Accession NP_036204.1) is another GAM180 target gene, herein designated TARGET GENE. C1QR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C1QR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1QR1 BINDING SITE, designated SEQ ID:6733, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27202] Another function of GAM180 is therefore inhibition of Complement component 1, q subcomponent, receptor 1 (C1QR1, Accession NP_036204.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QR1.

[27203] Chromosome 20 open reading frame 28 (C20orf28, Accession NP_056232.1) is another GAM180 target gene, herein designated TARGET GENE. C20orf28 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C20orf28, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the com-

plementarity of the nucleotide sequences of C20orf28 BINDING SITE, designated SEQ ID:15921, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27204] Another function of GAM180 is therefore inhibition of Chromosome 20 open reading frame 28 (C20orf28, Accession NP_056232.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf28.

[27205] Chromosome 20 open reading frame 70 (C20orf70, Accession XP_114180.1) is another GAM180 target gene, herein designated TARGET GENE. C20orf70 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C20orf70, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf70 BINDING SITE, designated SEQ ID:9329, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27206] Another function of GAM180 is therefore inhibition of Chromosome 20 open reading frame 70 (C20orf70, Accession XP_114180.1) . Accordingly, utilities of GAM180

include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf70.

[27207] Carbonic anhydrase xiv (CA14, Accession NP_036245.1) is another GAM180 target gene, herein designated TARGET GENE. CA14 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CA14, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CA14 BINDING SITE, designated SEQ ID:11029, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27208] Another function of GAM180 is therefore inhibition of Carbonic anhydrase xiv (CA14, Accession NP_036245.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CA14.

[27209] Calmodulin 1 (phosphorylase kinase, delta) (CALM1, Accession NP_008819.1) is another GAM180 target gene, herein designated TARGET GENE. CALM1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CALM1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CALM1 BINDING SITE, designated SEQ ID:13087, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27210] Another function of GAM180 is therefore inhibition of Calmodulin 1 (phosphorylase kinase, delta) (CALM1, Accession NP_008819.1), a gene which plays roles in growth and the cell cycle as well as in signal transduction and the synthesis and release of neurotransmitters. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALM1.

[27211] The function of CALM1 has been established by previous studies. Calmodulin is the archetype of the family of calcium- modulated proteins of which nearly 20 members have been found. They are identified by their occurrence in the cytosol or on membranes facing the cytosol and by a high affinity for calcium. Calmodulin contains 149 amino acids and has 4 calcium- binding domains. Its functions include roles in growth and the cell cycle as well as in signal transduction and the synthesis and release of neurotransmitters. To determine how calcium/calmodulin

activates calcium/calmodulin- dependent protein kinase I (CAMK1; 604998), Chin et al. (1997) characterized CAMK1 activation by calmodulin mutants with substitutions at hydrophobic residues. They found that CAMK1 activity is dependent on met124 within the C- terminal domain of calmodulin as well as on N- terminal hydrophobic residues of calmodulin.

[27212]

[27213] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27214] Rhyner, J. A.; Ottiger, M.; Wicki, R.; Greenwood, T. M.; Strehler, E. E. : Structure of the human CALM1 calmodulin gene and identification of two CALM1- related pseudogenes CALM1P1 and CALM1P2. Europ. J. Biochem. 225: 71- 82, 1994. ; and

[27215] Chin, D.; Winkler, K. E.; Means, A. R. : Characterization of substrate phosphorylation and use of calmodulin mutants to address implications from the enzyme crystal structure of calmodul.

[27216] Further studies establishing the function and utilities of CALM1 are found in John Hopkins OMIM database record ID 114180, and in cited publications listed in Table 5,

which are hereby incorporated by reference.Calumenin (CALU, Accession NP_001210.1) is another GAM180 target gene, herein designated TARGET GENE. CALU BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CALU, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CALU BINDING SITE, designated SEQ ID:544, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27217] Another function of GAM180 is therefore inhibition of Calumenin (CALU, Accession NP_001210.1), a gene which binds 7 calcium ions with a low affinity with unidtified function. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALU.

[27218] The function of CALU has been established by previous studies. Many calcium- binding proteins are reported to be localized in the endoplasmic reticulum (ER) and involved in such ER functions as protein folding and sorting. Among these are RCN1 (OMIM Ref. No. 602735), RCN2 (OMIM Ref. No. 602584), and calumenin (CALU), which

form a novel family of calcium- binding proteins in the ER and Golgi apparatus. By searching sequence databases with a mouse Calu cDNA sequence (Yabe et al., 1997), Yabe et al. (1998) identified a human CALU EST, which they used to clone a full- length CALU cDNA. The cDNA encodes a deduced 315- amino acid protein containing 6 EF- hand motifs, 1 potential N- glycosylation site, and a C- terminal ER retention signal. The human and mouse CALU proteins are 98% identical. Northern blot analysis demonstrated that the 3.4- kb CALU mRNA is ubiquitously expressed in human tissues. Southern blot analysis using a human CALU cDNA probe detected bands in a variety of species. Yabe et al. (1997) mapped the mouse Calu gene to the proximal portion of chromosome 7. By fluorescence in situ hybridization, Yabe et al. (1998) localized the human CALU gene to 7q32, which was an unexpected result due to the homology of synteny between proximal mouse chromosome 7 and human 19q13.2-q13.3.

[27219]

[27220] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27221] Yabe, D.; Nakamura, T.; Kanazawa, N.; Tashiro, K.; Honjo, T. : Calumenin, a Ca(2+)- binding protein retained in the endoplasmic reticulum with a novel carboxyl- terminal sequence, HDEF. J. Biol. Chem. 272: 18232- 18239, 1997. ; and

[27222] Yabe, D.; Taniwaki, M.; Nakamura, T.; Kanazawa, N.; Tashiro, K.; Honjo, T. : Human calumenin gene (CALU): cDNA isolation and chromosomal mapping to 7q32. Genomics 49: 331- 333, 1998.

[27223] Further studies establishing the function and utilities of CALU are found in John Hopkins OMIM database record ID 603420, and in cited publications listed in Table 5, which are hereby incorporated by reference.Caspase recruitment domain family, member 9 (CARD9, Accession NP_434700.1) is another GAM180 target gene, herein designated TARGET GENE. CARD9 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CARD9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CARD9 BINDING SITE, designated SEQ ID:11302, to the nucleotide sequence of GAM180 RNA, herein designated

GAM RNA, also designated SEQ ID:214.

[27224] Another function of GAM180 is therefore inhibition of Caspase recruitment domain family, member 9 (CARD9, Accession NP_434700.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARD9.

[27225] Caspase recruitment domain family, member 9 (CARD9, Accession NP_071747.2) is another GAM180 target gene, herein designated TARGET GENE. CARD9 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CARD9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CARD9 BINDING SITE, designated SEQ ID:11302, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27226] Another function of GAM180 is therefore inhibition of Caspase recruitment domain family, member 9 (CARD9, Accession NP_071747.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARD9.

[27227] Caspase recruitment domain family, member 9 (CARD9,

Accession NP_434701.1) is another GAM180 target gene, herein designated TARGET GENE. CARD9 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CARD9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CARD9 BINDING SITE, designated SEQ ID:11302, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27228] Another function of GAM180 is therefore inhibition of Caspase recruitment domain family, member 9 (CARD9, Accession NP_434701.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARD9.

[27229] Chemokine (c-c motif) ligand 11 (CCL11, Accession NP_002977.1) is another GAM180 target gene, herein designated TARGET GENE. CCL11 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CCL11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCL11 BINDING SITE, designated

SEQ ID:4942, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27230] Another function of GAM180 is therefore inhibition of Chemokine (c-c motif) ligand 11 (CCL11, Accession NP_002977.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCL11.

[27231] Chemokine (c-c motif) ligand 8 (CCL8, Accession NP_005614.2) is another GAM180 target gene, herein designated TARGET GENE. CCL8 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CCL8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCL8 BINDING SITE, designated SEQ ID:6343, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27232] Another function of GAM180 is therefore inhibition of Chemokine (c-c motif) ligand 8 (CCL8, Accession NP_005614.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCL8.

[27233] Cd22 antigen (CD22, Accession NP_001762.1) is another

GAM180 target gene, herein designated TARGET GENE. CD22 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CD22, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CD22 BINDING SITE, designated SEQ ID:5550, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27234] Another function of GAM180 is therefore inhibition of Cd22 antigen (CD22, Accession NP_001762.1), a gene which is an antigen expressed specifically in B lymphocytes (Cd22 antigen) and may act in cell- cell interactions. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD22.

[27235] The function of CD22 has been established by previous studies. Nonhuman mammalian cells express N- acetylneuraminic acid (OMIM Ref. No. Neu5Ac) and N- glycolylneuraminic acid (OMIM Ref. No. Neu5Gc). Human cells contain only Neu5Ac because of an exon deletion/ frameshift mutation in cytidine monophospho- sialic acid hydroxylase (CMAH; 603209), which converts Neu5Ac to

Neu5Gc. Sialic acid- binding immunoglobulin- like lectins, or SIGLECs, such as CD22 (SIGLEC2), recognize sialic acids. Brinkman- Van der Linden et al. (2000) showed that human SIGLEC1 (SN; 600751) strongly prefers Neu5Ac over Neu5Gc. Sequence analysis of SIGLEC2 cDNA found that while the chimpanzee sequence is 97% homologous to human, bonobo and gorilla are only 96% homologous, and the orangutan is only 93% homologous. Using regions of SIGLEC2 proteins from mouse, chimpanzee, orangutan, and human fused to the Fc region of human IgG, and flow cytometry analysis, Brinkman- Van der Linden et al. (2000) showed that all bound well to chimpanzee Epstein-Barr virus (EBV)- transformed B cells, which expressed high levels of Neu5Gc. Except for mouse, all bound well to human EBV- transformed B cells, which expressed high levels of Neu5Ac.

[27236] Animal model experiments lend further support to the function of CD22. O'Keefe et al. (1996) made observations in mice with a targeted disruption of the CD22 gene indicating that CD22 is a negative regulator of antigen receptor signaling whose onset of expression at the mature B cell stage may serve to raise the antigen concentration threshold required for B cell triggering. Splenic B cells

from CD22 knockout mice were found to be hyperresponsive to receptor signaling. Heightened calcium fluxes and cell proliferation were obtained at lower ligand concentrations. The mice gave augmented immune response, had an expanded peritoneal B- 1 cell population, and contained increased serum titers of autoantibody.

[27237] It is appreciated that the abovementioned animal model for CD22 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[27238] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27239] O'Keefe, T. L.; Williams, G. T.; Davies, S. L.; Neuberger, M. S. : Hyperresponsive B cells in CD22- deficient mice. Science 274: 798- 801, 1996. ; and

[27240] Brinkman- Van der Linden, E. C. M.; Sjoberg, E. R.; Juneja, L. R.; Crocker, P. R.; Varki, N.; Varki, A. : Loss of N- glycolylneuraminic acid in human evolution: implications for sialic aci.

[27241] Further studies establishing the function and utilities of CD22 are found in John Hopkins OMIM database record ID 107266, and in cited publications listed in Table 5, which

are hereby incorporated by reference.Cdk5 regulatory subunit associated protein 3 (CDK5RAP3, Accession NP_079473.2) is another GAM180 target gene, herein designated TARGET GENE. CDK5RAP3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CDK5RAP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDK5RAP3 BINDING SITE, designated SEQ ID:3530, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27242] Another function of GAM180 is therefore inhibition of Cdk5 regulatory subunit associated protein 3 (CDK5RAP3, Accession NP_079473.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDK5RAP3.

[27243] Cdk5 regulatory subunit associated protein 3 (CDK5RAP3, Accession NP_788275.1) is another GAM180 target gene, herein designated TARGET GENE. CDK5RAP3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by

CDK5RAP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDK5RAP3 BINDING SITE, designated SEQ ID:3530, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27244] Another function of GAM180 is therefore inhibition of Cdk5 regulatory subunit associated protein 3 (CDK5RAP3, Accession NP_788275.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDK5RAP3.

[27245] Chitinase 3-like 2 (CHI3L2, Accession NP_003991.1) is another GAM180 target gene, herein designated TARGET GENE. CHI3L2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CHI3L2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHI3L2 BINDING SITE, designated SEQ ID:13391, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ

ID:214.

[27246] Another function of GAM180 is therefore inhibition of Chitinase 3-like 2 (CHI3L2, Accession NP_003991.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHI3L2.

[27247] Carbohydrate (chondroitin 6) sulfotransferase 3 (CHST3, Accession NP_004264.2) is another GAM180 target gene, herein designated TARGET GENE. CHST3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CHST3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHST3 BINDING SITE, designated SEQ ID:19995, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27248] Another function of GAM180 is therefore inhibition of Carbohydrate (chondroitin 6) sulfotransferase 3 (CHST3, Accession NP_004264.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST3.

[27249] Carbohydrate (n-acetylglucosamine 6-o) sulfotransferase

5 (CHST5, Accession NP_036258.1) is another GAM180 target gene, herein designated TARGET GENE. CHST5 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CHST5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHST5 BINDING SITE, designated SEQ ID:6807, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27250] Another function of GAM180 is therefore inhibition of Carbohydrate (n-acetylglucosamine 6-o) sulfotransferase 5 (CHST5, Accession NP_036258.1), a gene which may be involved in sulfation of glycoproteins and proteoglycans. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST5.

[27251] The function of CHST5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM175.1.Collagen, type iv, alpha 4 (COL4A4, Accession NP_000083.1) is another GAM180 target gene, herein designated TARGET GENE. COL4A4 BINDING SITE is a tar-

get binding site found in the 3` untranslated region of mRNA encoded by COL4A4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COL4A4 BINDING SITE, designated SEQ ID:5844, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27252] Another function of GAM180 is therefore inhibition of Collagen, type iv, alpha 4 (COL4A4, Accession NP_000083.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL4A4.

[27253] Doublecortin and cam kinase-like 1 (DCAMKL1, Accession NP_004725.1) is another GAM180 target gene, herein designated TARGET GENE. DCAMKL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DCAMKL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DCAMKL1 BINDING SITE, designated SEQ ID:2905, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA,

also designated SEQ ID:214.

[27254] Another function of GAM180 is therefore inhibition of Doublecortin and cam kinase-like 1 (DCAMKL1, Accession NP_004725.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCAMKL1.

[27255] DKFZP434F011 (Accession XP_291159.1) is another GAM180 target gene, herein designated TARGET GENE. DKFZP434F011 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP434F011, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434F011 BINDING SITE, designated SEQ ID:7730, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27256] Another function of GAM180 is therefore inhibition of DKFZP434F011 (Accession XP_291159.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434F011.

[27257] DKFZP564O0423 (Accession XP_166254.2) is another

GAM180 target gene, herein designated TARGET GENE. DKFZP564O0423 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP564O0423, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP564O0423 BINDING SITE, designated SEQ ID:8990, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27258] Another function of GAM180 is therefore inhibition of DKFZP564O0423 (Accession XP_166254.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O0423.

[27259] DKFZP586I2223 (Accession NP_542768.1) is another GAM180 target gene, herein designated TARGET GENE. DKFZP586I2223 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by DKFZP586I2223, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DK-

FZP586I2223 BINDING SITE, designated SEQ ID:11679, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27260] Another function of GAM180 is therefore inhibition of DKFZP586I2223 (Accession NP_542768.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586I2223.

[27261] DKFZP586I2223 (Accession NP_056253.2) is another GAM180 target gene, herein designated TARGET GENE. DKFZP586I2223 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by DKFZP586I2223, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP586I2223 BINDING SITE, designated SEQ ID:11679, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27262] Another function of GAM180 is therefore inhibition of DKFZP586I2223 (Accession NP_056253.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

DKFZP586I2223.

[27263] DKFZp761K1423 (Accession NP_060892.1) is another GAM180 target gene, herein designated TARGET GENE. DKFZp761K1423 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZp761K1423, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761K1423 BINDING SITE, designated SEQ ID:10603, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27264] Another function of GAM180 is therefore inhibition of DKFZp761K1423 (Accession NP_060892.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761K1423.

[27265] DKFZP761M1511 (Accession XP_295135.1) is another GAM180 target gene, herein designated TARGET GENE. DKFZP761M1511 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP761M1511, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP761M1511 BINDING SITE, designated SEQ ID:898, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27266] Another function of GAM180 is therefore inhibition of DKFZP761M1511 (Accession XP_295135.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP761M1511.

[27267] DKFZp762E1312 (Accession NP_060880.2) is another GAM180 target gene, herein designated TARGET GENE. DKFZp762E1312 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZp762E1312, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp762E1312 BINDING SITE, designated SEQ ID:19364, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27268] Another function of GAM180 is therefore inhibition of DKFZp762E1312 (Accession NP_060880.2) . Accordingly,

utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762E1312.

[27269] Dopamine receptor d2 (DRD2, Accession NP_000786.1) is another GAM180 target gene, herein designated TARGET GENE. DRD2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DRD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DRD2 BINDING SITE, designated SEQ ID:8911, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27270] Another function of GAM180 is therefore inhibition of Dopamine receptor d2 (DRD2, Accession NP_000786.1), a gene which has a key role in the control of movement. and therefore may be associated with Hereditary autosomal dominant myoclonus dystonia. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of Hereditary autosomal dominant myoclonus dystonia, and of other diseases and clinical conditions associated with DRD2.

[27271] The function of DRD2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM148.1.Dopamine receptor d2 (DRD2, Accession NP_057658.2) is another GAM180 target gene, herein designated TARGET GENE. DRD2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DRD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DRD2 BINDING SITE, designated SEQ ID:8911, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27272] Another function of GAM180 is therefore inhibition of Dopamine receptor d2 (DRD2, Accession NP_057658.2), a gene which has a key role in the control of movement. and therefore may be associated with Hereditary autosomal dominant myoclonus dystonia. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of Hereditary autosomal dominant myoclonus dystonia, and of other diseases and clinical conditions associated with DRD2.

[27273] The function of DRD2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM148.1.Dual specificity phosphatase 2 (DUSP2, Accession NP_004409.1) is another GAM180 target gene, herein designated TARGET GENE. DUSP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DUSP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DUSP2 BINDING SITE, designated SEQ ID:13525, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27274] Another function of GAM180 is therefore inhibition of Dual specificity phosphatase 2 (DUSP2, Accession NP_004409.1), a gene which regulates mitogenic signal transduction. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DUSP2.

[27275] The function of DUSP2 has been established by previous studies. Mitogenic stimulation of quiescent cells leads to the rapid and reversible activation of mitogen- activated

protein (MAP) kinases via dual phosphorylation within a thr- glu- tyr motif. Following activation, MAP kinases translocate into the nucleus where they phosphorylate several signal transduction targets. The dual- specificity phosphatases can reverse MAP kinase activation by de-phosphorylating phosphotyrosine and phosphothreonine residues. Rohan et al. (1993) isolated mouse and human cDNAs encoding PAC1, a mitogen- induced 32- kD protein that contains a sequence that is associated with enzymatic activity in previously identified protein phosphotyrosine phosphatases. The predicted human PAC1 protein has 314 amino acids. Northern blot analysis of human cell lines and mouse tissues revealed that PAC1 is expressed predominantly in hematopoietic tissues. By immunofluorescence of transfected cells and mitogen- stimulated T cells, Rohan et al. (1993) localized PAC1 to the nucleus. Ward et al. (1994) demonstrated that PAC1 is a dual- specific thr/tyr phosphatase that is a physiologically relevant MAP kinase phosphatase. Yi et al. (1995) determined that the PAC1, or DUSP2, gene contains 4 exons that span approximately 2.3 kb. By somatic cell hybrid analysis, linkage analysis, and in situ hybridization, Yi et al. (1995) mapped the PAC1 gene to 2p11.2- q11. Using

fluorescence in situ hybridization, Martell et al. (1994) refined the localization of the PAC1 gene to 2q11.

[27276]

[27277] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27278] Rohan, P. J.; Davis, P.; Moskaluk, C. A.; Kearns, M.; Krutzsch, H.; Siebenlist, U.; Kelly, K. : PAC- 1: a mitogen-induced nuclear protein tyrosine phosphatase. Science 259: 1763- 1766, 1993. ; and

[27279] Yi, H.; Morton, C. C.; Weremowicz, S.; McBride, O. W.; Kelly, K. : Genomic organization and chromosomal localization of the DUSP2 gene, encoding a MAP kinase phosphatase, to human 2p11.

[27280] Further studies establishing the function and utilities of DUSP2 are found in John Hopkins OMIM database record ID 603068, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ephrin-a3 (EFNA3, Accession NP_004943.1) is another GAM180 target gene, herein designated TARGET GENE. EFNA3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EFNA3, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EFNA3 BINDING SITE, designated SEQ ID:19601, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27281] Another function of GAM180 is therefore inhibition of Ephrin-a3 (EFNA3, Accession NP_004943.1), a gene which is a ligand of Eph- related receptor tyrosine kinases. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFNA3.

[27282] The function of EFNA3 has been established by previous studies. Proteins in the LERK subfamily of ligands, called ephrins, bind to members of the EPH group of receptor tyrosine kinases. The various ephrins are characterized by sequence similarities and the fact that they are attached to the cell membrane by glycosylphosphatidylinositol (GPI) anchors or by a single transmembrane domain. See 179610 for additional information on ephrins and the Eph receptor family. By fluorescence in situ hybridization, Cerretti et al. (1996) mapped the EPLG3 gene to a cluster on chromosome 1q21- q22, together with EPLG1 (EFNA1; 191164) and EPLG4 (EFNA4; 601380). By interspecific

backcross analysis, they mapped the mouse EPLG3 homolog (Epl3) to the central region of mouse chromosome 3. Cerretti and Nelson (1998) reported that the mouse Efna3 gene has 5 exons. The gene structures of human EFNA2 (OMIM Ref. No. 602756) and mouse Efna3, Efna4 (OMIM Ref. No. 601380), and Efnb1 (OMIM Ref. No. 300035) are conserved through the first 3 exons.

[27283]

[27284] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27285] Cerretti, D. P.; Lyman, S. D.; Kozlosky, C. J.; Copeland, N. G.; Gilbert, D. J.; Jenkins, N. A.; Valentine, V.; Kirstein, M. N.; Shapiro, D. N.; Morris, S. W. : The genes encoding the Eph- related receptor tyrosine kinase ligands LERK- 1 (EPLG1, Epl1), LERK- 3 (EPLG3, Epl3), and LERK- 4 (EPLG4, Epl4) are clustered on human chromosome 1 and mouse chromosome 3. Genomics 33: 277- 282, 1996. ; and

[27286] Cerretti, D. P.; Nelson, N. : Characterization of the genes for mouse LERK- 3/Ephrin- A3 (Epl3), mouse LERK- 4/Ephrin- A4 (Epl4), and human LERK- 6/Ephrin- A2 (EPLG6): conservation of intron/e.

[27287] Further studies establishing the function and utilities of

EFNA3 are found in John Hopkins OMIM database record ID 601381, and in cited publications listed in Table 5, which are hereby incorporated by reference.ELKS (Accession NP_055879.1) is another GAM180 target gene, herein designated TARGET GENE. ELKS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ELKS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ELKS BINDING SITE, designated SEQ ID:787, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27288] Another function of GAM180 is therefore inhibition of ELKS (Accession NP_055879.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELKS.

[27289] Ellis van creveld syndrome (EVC, Accession NP_055371.1) is another GAM180 target gene, herein designated TARGET GENE. EVC BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EVC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EVC BINDING SITE, designated SEQ ID:5644, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27290] Another function of GAM180 is therefore inhibition of Ellis van creveld syndrome (EVC, Accession NP_055371.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVC.

[27291] Fibroblast growth factor receptor 1 (fms-related tyrosine kinase 2, pfeiffer syndrome) (FGFR1, Accession NP_075598.1) is another GAM180 target gene, herein designated TARGET GENE. FGFR1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FGFR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FGFR1 BINDING SITE, designated SEQ ID:5084, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27292] Another function of GAM180 is therefore inhibition of Fibroblast growth factor receptor 1 (fms-related tyrosine

kinase 2, pfeiffer syndrome) (FGFR1, Accession NP_075598.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGFR1.

[27293] FHX (Accession NP_060886.1) is another GAM180 target gene, herein designated TARGET GENE. FHX BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FHX, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FHX BINDING SITE, designated SEQ ID:12381, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27294] Another function of GAM180 is therefore inhibition of FHX (Accession NP_060886.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FHX.

[27295] FKSG42 (Accession NP_114421.1) is another GAM180 target gene, herein designated TARGET GENE. FKSG42 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FKSG42, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FKSG42 BINDING SITE, designated SEQ ID:17992, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27296] Another function of GAM180 is therefore inhibition of FKSG42 (Accession NP_114421.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKSG42.

[27297] FLJ10648 (Accession NP_060637.1) is another GAM180 target gene, herein designated TARGET GENE. FLJ10648 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ10648, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10648 BINDING SITE, designated SEQ ID:4717, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27298] Another function of GAM180 is therefore inhibition of FLJ10648 (Accession NP_060637.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ10648.

[27299] FLJ10970 (Accession NP_060756.1) is another GAM180 target gene, herein designated TARGET GENE. FLJ10970 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ10970, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10970 BINDING SITE, designated SEQ ID:13268, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27300] Another function of GAM180 is therefore inhibition of FLJ10970 (Accession NP_060756.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10970.

[27301] FLJ11700 (Accession NP_079168.1) is another GAM180 target gene, herein designated TARGET GENE. FLJ11700 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11700, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ11700 BINDING SITE, designated SEQ ID:3258, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27302] Another function of GAM180 is therefore inhibition of FLJ11700 (Accession NP_079168.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11700.

[27303] FLJ12577 (Accession NP_112187.1) is another GAM180 target gene, herein designated TARGET GENE. FLJ12577 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12577, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12577 BINDING SITE, designated SEQ ID:7536, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27304] Another function of GAM180 is therefore inhibition of FLJ12577 (Accession NP_112187.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12577.

[27305] FLJ12587 (Accession NP_071925.2) is another GAM180 target gene, herein designated TARGET GENE. FLJ12587 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12587, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12587 BINDING SITE, designated SEQ ID:1658, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27306] Another function of GAM180 is therefore inhibition of FLJ12587 (Accession NP_071925.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12587.

[27307] FLJ13902 (Accession NP_078929.1) is another GAM180 target gene, herein designated TARGET GENE. FLJ13902 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13902, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13902 BINDING SITE, designated SEQ ID:19221, to the

nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27308] Another function of GAM180 is therefore inhibition of FLJ13902 (Accession NP_078929.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13902.

[27309] FLJ14166 (Accession NP_078841.1) is another GAM180 target gene, herein designated TARGET GENE. FLJ14166 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14166, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14166 BINDING SITE, designated SEQ ID:3589, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27310] Another function of GAM180 is therefore inhibition of FLJ14166 (Accession NP_078841.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14166.

[27311] FLJ14249 (Accession NP_567825.1) is another GAM180

target gene, herein designated TARGET GENE. FLJ14249 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FLJ14249, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14249 BINDING SITE, designated SEQ ID:14831, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27312] Another function of GAM180 is therefore inhibition of FLJ14249 (Accession NP_567825.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14249.

[27313] FLJ14249 (Accession NP_071905.2) is another GAM180 target gene, herein designated TARGET GENE. FLJ14249 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FLJ14249, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14249 BINDING SITE, designated

SEQ ID:14831, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27314] Another function of GAM180 is therefore inhibition of FLJ14249 (Accession NP_071905.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14249.

[27315] FLJ14936 (Accession NP_115660.1) is another GAM180 target gene, herein designated TARGET GENE. FLJ14936 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FLJ14936, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14936 BINDING SITE, designated SEQ ID:6933, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27316] Another function of GAM180 is therefore inhibition of FLJ14936 (Accession NP_115660.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14936.

[27317] FLJ20174 (Accession NP_060169.1) is another GAM180 target gene, herein designated TARGET GENE. FLJ20174 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20174, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20174 BINDING SITE, designated SEQ ID:4747, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27318] Another function of GAM180 is therefore inhibition of FLJ20174 (Accession NP_060169.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20174.

[27319] FLJ20297 (Accession NP_060421.1) is another GAM180 target gene, herein designated TARGET GENE. FLJ20297 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FLJ20297, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20297 BINDING SITE, designated

SEQ ID:1321, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27320] Another function of GAM180 is therefore inhibition of FLJ20297 (Accession NP_060421.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20297.

[27321] FLJ20297 (Accession NP_060221.1) is another GAM180 target gene, herein designated TARGET GENE. FLJ20297 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FLJ20297, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20297 BINDING SITE, designated SEQ ID:1321, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27322] Another function of GAM180 is therefore inhibition of FLJ20297 (Accession NP_060221.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20297.

[27323] FLJ20298 (Accession NP_060222.1) is another GAM180

target gene, herein designated TARGET GENE. FLJ20298 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20298, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20298 BINDING SITE, designated SEQ ID:11216, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27324] Another function of GAM180 is therefore inhibition of FLJ20298 (Accession NP_060222.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20298.

[27325] FLJ20511 (Accession NP_060323.1) is another GAM180 target gene, herein designated TARGET GENE. FLJ20511 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20511, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20511 BINDING SITE, designated SEQ ID:14414, to the nucleotide sequence of GAM180 RNA, herein designated

GAM RNA, also designated SEQ ID:214.

[27326] Another function of GAM180 is therefore inhibition of FLJ20511 (Accession NP_060323.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20511.

[27327] FLJ20573 (Accession XP_033853.2) is another GAM180 target gene, herein designated TARGET GENE. FLJ20573 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ20573, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20573 BINDING SITE, designated SEQ ID:11877, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27328] Another function of GAM180 is therefore inhibition of FLJ20573 (Accession XP_033853.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20573.

[27329] FLJ20666 (Accession NP_060392.1) is another GAM180 target gene, herein designated TARGET GENE. FLJ20666

BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FLJ20666, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20666 BINDING SITE, designated SEQ ID:8314, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27330] Another function of GAM180 is therefore inhibition of FLJ20666 (Accession NP_060392.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20666.

[27331] FLJ22167 (Accession NP_078809.2) is another GAM180 target gene, herein designated TARGET GENE. FLJ22167 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ22167, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22167 BINDING SITE, designated SEQ ID:6807, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27332] Another function of GAM180 is therefore inhibition of FLJ22167 (Accession NP_078809.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22167.

[27333] FLJ22578 (Accession NP_079140.1) is another GAM180 target gene, herein designated TARGET GENE. FLJ22578 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ22578, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22578 BINDING SITE, designated SEQ ID:8608, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27334] Another function of GAM180 is therefore inhibition of FLJ22578 (Accession NP_079140.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22578.

[27335] FLJ23074 (Accession NP_079328.1) is another GAM180 target gene, herein designated TARGET GENE. FLJ23074 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by FLJ23074, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23074 BINDING SITE, designated SEQ ID:16835, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27336] Another function of GAM180 is therefore inhibition of FLJ23074 (Accession NP_079328.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23074.

[27337] FLJ23462 (Accession NP_079119.2) is another GAM180 target gene, herein designated TARGET GENE. FLJ23462 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23462, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23462 BINDING SITE, designated SEQ ID:7500, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27338] Another function of GAM180 is therefore inhibition of

FLJ23462 (Accession NP_079119.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23462.

[27339] FLJ30679 (Accession NP_694562.1) is another GAM180 target gene, herein designated TARGET GENE. FLJ30679 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ30679, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ30679 BINDING SITE, designated SEQ ID:2972, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27340] Another function of GAM180 is therefore inhibition of FLJ30679 (Accession NP_694562.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30679.

[27341] FLJ32452 (Accession NP_653177.2) is another GAM180 target gene, herein designated TARGET GENE. FLJ32452 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32452, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32452 BINDING SITE, designated SEQ ID:2212, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27342] Another function of GAM180 is therefore inhibition of FLJ32452 (Accession NP_653177.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32452.

[27343] FLJ34658 (Accession NP_689617.2) is another GAM180 target gene, herein designated TARGET GENE. FLJ34658 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ34658, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ34658 BINDING SITE, designated SEQ ID:4616, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27344] Another function of GAM180 is therefore inhibition of FLJ34658 (Accession NP_689617.2) . Accordingly, utilities

of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ34658.

[27345] FLJ34817 (Accession NP_689516.1) is another GAM180 target gene, herein designated TARGET GENE. FLJ34817 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ34817, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ34817 BINDING SITE, designated SEQ ID:1005, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27346] Another function of GAM180 is therefore inhibition of FLJ34817 (Accession NP_689516.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ34817.

[27347] FLJ39957 (Accession NP_689749.1) is another GAM180 target gene, herein designated TARGET GENE. FLJ39957 BINDING SITE1 and FLJ39957 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ39957, corresponding to target binding sites

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ39957 BINDING SITE1 and FLJ39957 BINDING SITE2, designated SEQ ID:12852 and SEQ ID:2358 respectively, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27348] Another function of GAM180 is therefore inhibition of FLJ39957 (Accession NP_689749.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ39957.

[27349] FLJ40235 (Accession NP_775906.1) is another GAM180 target gene, herein designated TARGET GENE. FLJ40235 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ40235, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ40235 BINDING SITE, designated SEQ ID:4486, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27350] Another function of GAM180 is therefore inhibition of

FLJ40235 (Accession NP_775906.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ40235.

[27351] FLJ90798 (Accession NP_699198.1) is another GAM180 target gene, herein designated TARGET GENE. FLJ90798 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ90798, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ90798 BINDING SITE, designated SEQ ID:14320, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27352] Another function of GAM180 is therefore inhibition of FLJ90798 (Accession NP_699198.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ90798.

[27353] Forkhead box p1 (FOXP1, Accession NP_116071.2) is another GAM180 target gene, herein designated TARGET GENE. FOXP1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FOXP1,

corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FOXP1 BINDING SITE, designated SEQ ID:19853, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27354] Another function of GAM180 is therefore inhibition of Forkhead box p1 (FOXP1, Accession NP_116071.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXP1.

[27355] Formyl peptide receptor 1 (FPR1, Accession NP_002020.1) is another GAM180 target gene, herein designated TARGET GENE. FPR1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FPR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FPR1 BINDING SITE, designated SEQ ID:2325, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27356] Another function of GAM180 is therefore inhibition of Formyl peptide receptor 1 (FPR1, Accession NP_002020.1)

. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FPR1.

[27357] Formyl peptide receptor-like 2 (FPRL2, Accession NP_002021.2) is another GAM180 target gene, herein designated TARGET GENE. FPRL2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FPRL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FPRL2 BINDING SITE, designated SEQ ID:13294, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27358] Another function of GAM180 is therefore inhibition of Formyl peptide receptor-like 2 (FPRL2, Accession NP_002021.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FPRL2.

[27359] Fucosyltransferase 3 (galactoside 3(4)-l-fucosyltransferase, lewis blood group included) (FUT3, Accession NP_000140.1) is another GAM180 target gene, herein designated TARGET GENE. FUT3 BINDING

SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FUT3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FUT3 BINDING SITE, designated SEQ ID:2915, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27360] Another function of GAM180 is therefore inhibition of Fucosyltransferase 3 (galactoside 3(4)-l-fucosyltransferase, lewis blood group included) (FUT3, Accession NP_000140.1), a gene which may catalyze alpha- 1,3 and alpha- 1,4 glycosidic linkages involved in the expression of vim- 2, lewis a, lewis b, sialyl lewis x and lewis x/ssea-1 antigens. and therefore may be associated with Lewis-negative disease. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of Lewis- negative disease., and of other diseases and clinical conditions associated with FUT3.

[27361] The function of FUT3 has been established by previous studies. The Lewis system involves genetically variable antigens in the body fluids and only secondarily are the antigens absorbed to red cells. Grollman et al. (1969)

showed that Lewis- negative women lack a specific fucosyltransferase which is present in the milk of Lewis- positive women. The enzyme is apparently required for synthesis of the structural determinants of both Lewis (a) and Lewis (b) specificity. The same enzyme is involved in the synthesis of milk oligosaccharides, because 2 oligosaccharides containing the relevant linkage were absent from the milk of Lewis- negative women. Grubb (1953) provided the ingenious interpretation of the interactions between the Les locus determining presence/absence of Lewis substance in the saliva and on red cells and the Se locus (OMIM Ref. No. 182100) determining secretion of ABH blood group substances in the saliva and Le(a) or Le(b) expression in red cells. In transfusion medicine, it has been found that some individuals who type as Lewis-positive on erythrocytes can change their erythrocyte phenotype to Lewis- negative during diseases or during pregnancy. Orntoft et al. (1996) noted that these patients have been named non- genuine Lewis- negative individuals as they have alpha- 1- 4 fucosyltransferase activity in saliva. Due to this phenomenon, the Lewis- negative phenotype is more common among cancer patients (approximately 20%) than among healthy individuals (approximately 8%).

Orntoft et al. (1996) examined the mutational spectrum of the Lewis gene in Denmark and found 6 different mutations. Five, 59T- G (L20R; 111100.0001), 202T- C (W68R), 314C- T (T105M), 508G- A (G170S; 111100.0001), and 1067T- A (I356K), were frequent, and 1, 445C- A (L146M), was only detected in 1 of 40 individuals. The authors demonstrated that the nucleotide 202 and 314 mutations were located on the same allele. COS- 7 cells transfected with an allele having the 202/314 mutations lacked enzyme activity. Lewis- negative patients, whose erythrocytes converted from Lewis- positive to Lewis- negative during their disease, showed FUT3 heterozygosity significantly more often than did others (p less than 0.05). Pang et al. (1998) identified 5 novel missense mutations in the FUT3 gene in African (Xhosa) and Caucasian subjects in South Africa.

[27362]

[27363] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27364] Grollman, E. F.; Kobata, A.; Ginsburg, V. : An enzymatic basis for Lewis blood types in man. J. Clin. Invest. 48: 1489- 1494, 1969. ; and

[27365] Orntoft, T. F.; Vestergaard, E. M.; Holmes, E.; Jakobsen, J. S.; Grunnet, N.; Mortensen, M.; Johnson, P.; Bross, P.; Gregersen, N.; Skorstengaard, K.; Jensen, U. B.; Bolund, L.; Wolf, H.

[27366] Further studies establishing the function and utilities of FUT3 are found in John Hopkins OMIM database record ID 111100, and in cited publications listed in Table 5, which are hereby incorporated by reference.Fucosyltransferase 5 (alpha (1,3) fucosyltransferase) (FUT5, Accession NP_002025.1) is another GAM180 target gene, herein designated TARGET GENE. FUT5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FUT5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FUT5 BINDING SITE, designated SEQ ID:2915, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27367] Another function of GAM180 is therefore inhibition of Fucosyltransferase 5 (alpha (1,3) fucosyltransferase) (FUT5, Accession NP_002025.1), a gene which may catalyse alpha- 1,3 glycosidic linkages involved in the expression of vim- 2, lewis x/ssea- 1 and sialyl lewis x antigens. Ac-

cordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUT5.

[27368] The function of FUT5 has been established by previous studies. Weston et al. (1992) isolated a human alpha- 3-fucosyltransferase gene homologous to but distinct from 2 previously reported fucosyltransferase genes: alpha-3,4- fucosyltransferase, thought to represent the human Lewis blood group locus (FUT3; 111100), and an alpha-3- fucosyltransferase expressed in the myeloid lineage (FUT4; 104230). The new enzyme shared 91% amino acid sequence identity with the Lewis blood group fucosyltransferase, yet exhibited only trace amounts of alpha- 4-fucosyltransferase activity. By PCR analysis of somatic cell hybrid DNAs, Weston et al. (1992) demonstrated that the gene is located on chromosome 19. They concluded that the gene encodes a 'plasma type' of alpha- 3- fucosyltransferase. McCurley et al. (1995) mapped FUT5 to 19p13.3 by fluorescence in situ hybridization using cosmids containing FUT6 (OMIM Ref. No. 136836) and FUT5. The results indicated that FUT6 lies approximately 70 kb telomeric of FUT5. McCurley et al. (1995) used conventional and pulsed field gel electrophoresis mapping to to-

tal genomic DNA and large genomic clones in order to generate a fine map of the cluster of 19p FUT genes. A P1 clone indicated the gene order: cen- - FUT5- - FUT3- - FUT6- - tel. FUT5 and FUT3 are separated by 23 kb and FUT3 and FUT6 are separated by 14 kb; these data placed FUT5 and FUT6 closer together than was estimated by fluorescence in situ hybridization. The close proximity and tandem orientation of the 3 genes suggests coordinate regulation. The direction of transcription is toward the telomere in the case of all 3 genes

[27369]

[27370] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27371] McCurley, R. S.; Recinos, A., III; Olsen, A. S.; Gingrich, J. C.; Szczepaniak, D.; Cameron, H. S.; Krauss, R.; Weston, B. W. : Physical maps of human alpha(1,3)fucosyltransferase genes FUT3- FUT6 on chromosomes 19p13.3 and 11q21. Genomics 26: 142- 146, 1995. ; and

[27372] Weston, B. W.; Nair, R. P.; Larsen, R. D.; Lowe, J. B. : Isolation of a novel human alpha(1,3)fucosyltransferase gene and molecular comparison to the human Lewis blood group alpha(1,3/1.

[27373] Further studies establishing the function and utilities of FUT5 are found in John Hopkins OMIM database record ID 136835, and in cited publications listed in Table 5, which are hereby incorporated by reference.Fucosyltransferase 6 (alpha (1,3) fucosyltransferase) (FUT6, Accession NP_000141.1) is another GAM180 target gene, herein designated TARGET GENE. FUT6 BINDING SITE1 and FUT6 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FUT6, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FUT6 BINDING SITE1 and FUT6 BINDING SITE2, designated SEQ ID:5353 and SEQ ID:7499 respectively, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27374] Another function of GAM180 is therefore inhibition of Fucosyltransferase 6 (alpha (1,3) fucosyltransferase) (FUT6, Accession NP_000141.1), a gene which is involved in the biosynthesis of the e- selectin ligand, sialyl- lewis x. catalyzes the transfer of fucose from gdp- beta- fucose to alpha- 2,3 sialylated substrates. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FUT6.

[27375] The function of FUT6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.Fxyd domain containing ion transport regulator 3 (FXYD3, Accession NP_005962.1) is another GAM180 target gene, herein designated TARGET GENE. FXYD3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FXYD3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FXYD3 BINDING SITE, designated SEQ ID:3047, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27376] Another function of GAM180 is therefore inhibition of Fxyd domain containing ion transport regulator 3 (FXYD3, Accession NP_005962.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FXYD3.

[27377] Fxyd domain containing ion transport regulator 3 (FXYD3, Accession NP_068710.1) is another GAM180 target gene, herein designated TARGET GENE. FXYD3 BINDING SITE is a

target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FXYD3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FXYD3 BINDING SITE, designated SEQ ID:3047, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27378] Another function of GAM180 is therefore inhibition of Fxyd domain containing ion transport regulator 3 (FXYD3, Accession NP_068710.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FXYD3.

[27379] Gamma-aminobutyric acid (gaba) b receptor, 1 (GABBR1, Accession NP_068705.1) is another GAM180 target gene, herein designated TARGET GENE. GABBR1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GABBR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GABBR1 BINDING SITE, designated SEQ ID:7008, to the nucleotide sequence of GAM180 RNA, herein designated

GAM RNA, also designated SEQ ID:214.

[27380] Another function of GAM180 is therefore inhibition of Gamma-aminobutyric acid (gaba) b receptor, 1 (GABBR1, Accession NP_068705.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABBR1.

[27381] GAC1 (Accession NP_006329.1) is another GAM180 target gene, herein designated TARGET GENE. GAC1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GAC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GAC1 BINDING SITE, designated SEQ ID:7458, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27382] Another function of GAM180 is therefore inhibition of GAC1 (Accession NP_006329.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAC1.

[27383] Glycoprotein a repetitions predominant (GARP, Accession NP_005503.1) is another GAM180 target gene, herein designated TARGET GENE. GARP BINDING SITE is a target

binding site found in the 3` untranslated region of mRNA encoded by GARP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GARP BINDING SITE, designated SEQ ID:10909, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27384] Another function of GAM180 is therefore inhibition of Glycoprotein a repetitions predominant (GARP, Accession NP_005503.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GARP.

[27385] Glucocorticoid induced transcript 1 (GLCCI1, Accession XP_166529.2) is another GAM180 target gene, herein designated TARGET GENE. GLCCI1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GLCCI1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GLCCI1 BINDING SITE, designated SEQ ID:14024, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:214.

[27386] Another function of GAM180 is therefore inhibition of Glucocorticoid induced transcript 1 (GLCCI1, Accession XP_166529.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLCCI1.

[27387] Glutamate-ammonia ligase (glutamine synthase) (GLUL, Accession NP_002056.2) is another GAM180 target gene, herein designated TARGET GENE. GLUL BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GLUL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GLUL BINDING SITE, designated SEQ ID:661, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27388] Another function of GAM180 is therefore inhibition of Glutamate-ammonia ligase (glutamine synthase) (GLUL, Accession NP_002056.2), a gene which catalyzes the condensation of glutamate and ammonia to form glutamine. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with GLUL.

[27389] The function of GLUL has been established by previous studies. Glutamine synthetase (EC 6.3.1.2), also called glutamate- ammonia ligase (GLUL), is expressed throughout the body and plays an important role in controlling body pH and in removing ammonia from the circulation. The enzyme clears L- glutamate, the major neurotransmitter in the central nervous system, from neuronal synapses (see OMIM Ref. No. references in Clancy et al., 1996). Gibbs et al. (1987) reported the complete 1,119-bp coding sequence of glutamine synthetase, which they determined from a liver- derived cDNA. Pesole et al. (1991) suggested that glutamine synthetase is a good molecular clock for determining times of divergence even as great as that which occurred between eukaryotes and prokaryotes. One conclusion reached by Pesole et al. (1991) was that organelle- specific enzymes, such as those of the mitochondria, may have originated from a duplication of nuclear genes. The endosymbiotic hypothesis suggests that a transfer of prokaryotic genes to nuclei occurred during the evolution of the primitive eukaryotic cell. In some cases, it is likely that the old prokaryotic gene could not be active in the new nuclear genome envi-

ronment and was totally lost because its function in the organelle could be dispensed with. Subsequently, a new organelle- specific enzyme could have originated to serve specialized metabolic functions. The presence of glutamine synthetase in mitochondria is linked to the nitrogen metabolism of the species, and in particular to the need for glutamine as a source of ammonia and for particular biochemical pathways for ammonia detoxification.

[27391] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27392] Gibbs, C. S.; Campbell, K. E.; Wilson, R. H. : Sequence of a human glutamine synthetase cDNA. Nucleic Acids Res. 15: 6293 only, 1987. ; and

[27393] Pesole, G.; Bozzetti, M. P.; Lanave, C.; Preparata, G.; Saccone, C. : Glutamine synthetase gene evolution: a good molecular clock. Proc. Nat. Acad. Sci. 88: 522- 526, 1991.

[27394] Further studies establishing the function and utilities of GLUL are found in John Hopkins OMIM database record ID 138290, and in cited publications listed in Table 5, which are hereby incorporated by reference.gm117 (Accession XP_086187.1) is another GAM180 target gene, herein

designated TARGET GENE. gm117 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by gm117, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of gm117 BINDING SITE, designated SEQ ID:1842, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27395] Another function of GAM180 is therefore inhibition of gm117 (Accession XP_086187.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with gm117.

[27396] GPR124 (Accession NP_116166.6) is another GAM180 target gene, herein designated TARGET GENE. GPR124 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPR124, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPR124 BINDING SITE, designated SEQ ID:14853, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27397] Another function of GAM180 is therefore inhibition of

GPR124 (Accession NP_116166.6) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR124.

[27398] Hyaluronan synthase 3 (HAS3, Accession NP_005320.2) is another GAM180 target gene, herein designated TARGET GENE. HAS3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HAS3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HAS3 BINDING SITE, designated SEQ ID:17871, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27399] Another function of GAM180 is therefore inhibition of Hyaluronan synthase 3 (HAS3, Accession NP_005320.2), a gene which plays a role in hyaluronan/hyaluronic acid (ha) synthesis. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HAS3.

[27400] The function of HAS3 has been established by previous studies. Hyaluronan (HA) is an unbranched glycosamino-

glycan composed of repeating disaccharide units. It is a major constituent of the extracellular matrix and has been implicated in development, tumorigenesis, and several diseases. HA is synthesized at the inner face of the plasma membrane and is subsequently extruded to the outside of the cell. By degenerate PCR, Spicer et al. (1997) isolated a genomic fragment of human HA synthase- 3 (HAS3) and genomic and cDNA clones of mouse Has3. The amino acid sequences encoded by the partial HAS3 fragment and the corresponding region of Has3 are 99% conserved. The authors noted that the high degree of sequence conservation between specific human and mouse HASs contrasts with the lower level of identity between HASs within a species, suggesting an evolutionary conservation of functionally important residues and differences in the mode of action of the various HASs. The predicted 554- amino acid Has3 has several consensus HA- binding motifs and multiple transmembrane domains, with 2 at the N terminus and a cluster at the C terminus. Expression of Has3 in COS- 1 cells led to high levels of HA biosynthesis. Northern blot analysis of the mouse embryo showed that Has3 is predominantly expressed at late gestation as a major, approximately 6.0- to 6.5- kb transcript and a minor, ap-

proximately 4.0- kb transcript. By PCR screening somatic cell hybrid DNAs and a YAC contig, Spicer et al. (1997) localized the human HAS3 gene to 16q22.1. By interspecific backcross analysis, they mapped the mouse Has3 gene to chromosome 8. Since HAS1 (OMIM Ref. No. 601463), HAS2 (OMIM Ref. No. 601636), and HAS3 are located on different autosomes, Spicer et al. (1997) suggested that the HAS gene family arose comparatively early in vertebrate evolution by sequential duplication of an ancestral HAS gene.

[27401]

[27402] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27403] Spicer, A. P.; Olson, J. S.; McDonald, J. A. : Molecular cloning and characterization of a cDNA encoding the third putative mammalian hyaluronan synthase. J. Biol. Chem. 272: 8957- 8961, 1997. ; and

[27404] Spicer, A. P.; Seldin, M. F.; Olsen, A. S.; Brown, N.; Wells, D. E.; Doggett, N. A.; Itano, N.; Kimata, K.; Inazawa, J.; McDonald, J. A. : Chromosomal localization of the human and mous.

[27405] Further studies establishing the function and utilities of

HAS3 are found in John Hopkins OMIM database record ID 602428, and in cited publications listed in Table 5, which are hereby incorporated by reference.Huntingtin (huntington disease) (HD, Accession NP_002102.2) is another GAM180 target gene, herein designated TARGET GENE. HD BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HD BINDING SITE, designated SEQ ID:4516, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27406] Another function of GAM180 is therefore inhibition of Huntingtin (huntington disease) (HD, Accession NP_002102.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HD.

[27407] Huntingtin interacting protein 1 (HIP1, Accession NP_005329.2) is another GAM180 target gene, herein designated TARGET GENE. HIP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HIP1, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HIP1 BINDING SITE, designated SEQ ID:17634, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27408] Another function of GAM180 is therefore inhibition of Huntingtin interacting protein 1 (HIP1, Accession NP_005329.2), a gene which is a membrane protein and interacts with huntingtin. and therefore may be associated with Huntington disease. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of Huntington disease, and of other diseases and clinical conditions associated with HIP1.

[27409] The function of HIP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM72.1.Hiv-1 tat interactive protein, 60kda (HTATIP, Accession NP_006379.1) is another GAM180 target gene, herein designated TARGET GENE. HTATIP BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HTATIP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HTATIP BINDING SITE, designated SEQ ID:20106, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27410] Another function of GAM180 is therefore inhibition of Hiv-1 tat interactive protein, 60kda (HTATIP, Accession NP_006379.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTATIP.

[27411] Interleukin 4 induced 1 (IL4I1, Accession NP_690863.1) is another GAM180 target gene, herein designated TARGET GENE. IL4I1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by IL4I1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL4I1 BINDING SITE, designated SEQ ID:17359, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27412] Another function of GAM180 is therefore inhibition of Interleukin 4 induced 1 (IL4I1, Accession NP_690863.1) .

Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL4I1.

[27413] KIAA0258 (Accession NP_055600.1) is another GAM180 target gene, herein designated TARGET GENE. KIAA0258 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0258, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0258 BINDING SITE, designated SEQ ID:10239, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27414] Another function of GAM180 is therefore inhibition of KIAA0258 (Accession NP_055600.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0258.

[27415] KIAA0513 (Accession NP_055547.1) is another GAM180 target gene, herein designated TARGET GENE. KIAA0513 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0513, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0513 BINDING SITE, designated SEQ ID:931, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27416] Another function of GAM180 is therefore inhibition of KIAA0513 (Accession NP_055547.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0513.

[27417] KIAA0682 (Accession NP_055667.1) is another GAM180 target gene, herein designated TARGET GENE. KIAA0682 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KIAA0682, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0682 BINDING SITE, designated SEQ ID:12275, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27418] Another function of GAM180 is therefore inhibition of KIAA0682 (Accession NP_055667.1) . Accordingly, utilities

of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0682.

[27419] KIAA0753 (Accession NP_055619.1) is another GAM180 target gene, herein designated TARGET GENE. KIAA0753 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0753, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0753 BINDING SITE, designated SEQ ID:10688, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27420] Another function of GAM180 is therefore inhibition of KIAA0753 (Accession NP_055619.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0753.

[27421] KIAA0935 (Accession XP_052620.6) is another GAM180 target gene, herein designated TARGET GENE. KIAA0935 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0935, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0935 BINDING SITE, designated SEQ ID:17230, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27422] Another function of GAM180 is therefore inhibition of KIAA0935 (Accession XP_052620.6) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0935.

[27423] KIAA1111 (Accession XP_171233.1) is another GAM180 target gene, herein designated TARGET GENE. KIAA1111 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1111, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1111 BINDING SITE, designated SEQ ID:15309, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27424] Another function of GAM180 is therefore inhibition of KIAA1111 (Accession XP_171233.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1111.

[27425] KIAA1194 (Accession NP_056270.2) is another GAM180 target gene, herein designated TARGET GENE. KIAA1194 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1194, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1194 BINDING SITE, designated SEQ ID:5209, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27426] Another function of GAM180 is therefore inhibition of KIAA1194 (Accession NP_056270.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1194.

[27427] KIAA1268 (Accession XP_291055.1) is another GAM180 target gene, herein designated TARGET GENE. KIAA1268 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1268, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of KIAA1268 BINDING SITE, designated SEQ ID:16742, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27428] Another function of GAM180 is therefore inhibition of KIAA1268 (Accession XP_291055.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1268.

[27429] KIAA1765 (Accession XP_047355.1) is another GAM180 target gene, herein designated TARGET GENE. KIAA1765 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1765, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1765 BINDING SITE, designated SEQ ID:15863, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27430] Another function of GAM180 is therefore inhibition of KIAA1765 (Accession XP_047355.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1765.

[27431] KIAA2001 (Accession XP_291322.1) is another GAM180 target gene, herein designated TARGET GENE. KIAA2001 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA2001, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA2001 BINDING SITE, designated SEQ ID:16865, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27432] Another function of GAM180 is therefore inhibition of KIAA2001 (Accession XP_291322.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA2001.

[27433] KIAA2024 (Accession NP_742067.1) is another GAM180 target gene, herein designated TARGET GENE. KIAA2024 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA2024, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

KIAA2024 BINDING SITE, designated SEQ ID:9621, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27434] Another function of GAM180 is therefore inhibition of KIAA2024 (Accession NP_742067.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA2024.

[27435] Karyopherin (importin) beta 1 (KPNB1, Accession NP_002256.2) is another GAM180 target gene, herein designated TARGET GENE. KPNB1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KPNB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KPNB1 BINDING SITE, designated SEQ ID:15603, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27436] Another function of GAM180 is therefore inhibition of Karyopherin (importin) beta 1 (KPNB1, Accession NP_002256.2), a gene which is required for nuclear protein import and mediates docking of import substrate to

distinct nucleoporins. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KPNB1.

[27437] The function of KPNB1 has been established by previous studies. The import of proteins into the nucleus proceeds through the nuclear pore complex. Cytoplasmic proteins with a nuclear localization signal (NLS) bind to an importin- alpha/importin- beta heterodimer. The trimeric complex docks to the cytoplasmic periphery of the nuclear pore complex and is subsequently translocated through as a single entity. The import reaction is terminated by the direct binding of RAN (OMIM Ref. No. 601179) to KPNB, which dissociates the importin heterodimer. Gorlich et al. (1995) purified a 90- kD subunit of importin (importin-90) from Xenopus egg extracts and obtained a 188-amino acid partial protein sequence from internal peptides. Using the partial amino acid sequence, they isolated cDNAs encoding human importin- 90, or KPNB1, from a HeLa cell cDNA library. The sequence of the predicted 876- amino acid human KPNB1 protein is 93% identical to the 188- amino acid partial sequence of Xenopus importin- 90. Gorlich et al. (1995) showed that Xenopus importin- 60 and importin- 90 cooperate to form an import

receptor that distinguishes functional NLSs from nonfunctional ones and selectively binds import substrates to the nuclear envelope. Independently, Chi et al. (1995) identified cDNAs encoding human KPNB1. Based on the 97- kD product of in vitro translation, they designated the protein p97. Using a monoclonal antibody against bovine p97, Chi et al. (1995) localized p97 to the cytoplasm and nuclear envelope of bovine kidney cells. These authors found that recombinant human p97 binds zinc and that a bound metal ion is required for nuclear envelope- binding activity. Kutay et al. (1997) identified the regions of KPNB1 that interact with RAN, importin- alpha, and the nuclear pore complex. Bayliss et al. (2000) described the crystal structure of a complex between KPNB1 residues 1 to 442 and 5 tandem FxFG nucleoporin repeats from yeast Nsp1. By fluorescence in situ hybridization, Ayala- Madrigal et al. (2000) mapped the KPNB1 gene to chromosome 17q21. By FISH, Matsuda et al. (1996) mapped the mouse Kpnb1 gene to the proximal end of chromosome 11D.

[27438]

[27439] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27440] Ayala- Madrigal, M. L.; Doerr, S.; Ramirez- Duenas, M. L.; Hansmann, I. : Assignment of KPNA4 and KPNB1 encoding karyopherin alpha 4 and beta 1 to human chromosome bands 11q22 and 17q21 respectively, by in situ hybridization. Cytogenet. Cell Genet. 89: 258- 259, 2000. ; and

[27441] Bayliss, R.; Littlewood, T.; Stewart, M. : Structural basis for the interaction between FxFG nucleoporin repeats and importin- beta in nuclear trafficking. Cell 102: 99- 108, 2000.

[27442] Further studies establishing the function and utilities of KPNB1 are found in John Hopkins OMIM database record ID 602738, and in cited publications listed in Table 5, which are hereby incorporated by reference.LOC114987 (Accession NP_660284.1) is another GAM180 target gene, herein designated TARGET GENE. LOC114987 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC114987, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC114987 BINDING SITE, designated SEQ ID:1173, to the nucleotide sequence of GAM180 RNA, herein designated

GAM RNA, also designated SEQ ID:214.

[27443] Another function of GAM180 is therefore inhibition of LOC114987 (Accession NP_660284.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC114987.

[27444] LOC116437 (Accession XP_058185.1) is another GAM180 target gene, herein designated TARGET GENE. LOC116437 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC116437, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC116437 BINDING SITE, designated SEQ ID:1933, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27445] Another function of GAM180 is therefore inhibition of LOC116437 (Accession XP_058185.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116437.

[27446] LOC126162 (Accession XP_064964.5) is another GAM180 target gene, herein designated TARGET GENE. LOC126162

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC126162, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC126162 BINDING SITE, designated SEQ ID:16559, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27447] Another function of GAM180 is therefore inhibition of LOC126162 (Accession XP_064964.5) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126162.

[27448] LOC126767 (Accession XP_060167.4) is another GAM180 target gene, herein designated TARGET GENE. LOC126767 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC126767, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC126767 BINDING SITE, designated SEQ ID:8959, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27449] Another function of GAM180 is therefore inhibition of LOC126767 (Accession XP_060167.4) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126767.

[27450] LOC129198 (Accession XP_072197.3) is another GAM180 target gene, herein designated TARGET GENE. LOC129198 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC129198, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC129198 BINDING SITE, designated SEQ ID:13916, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27451] Another function of GAM180 is therefore inhibition of LOC129198 (Accession XP_072197.3) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129198.

[27452] LOC142941 (Accession XP_096363.1) is another GAM180 target gene, herein designated TARGET GENE. LOC142941 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC142941, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC142941 BINDING SITE, designated SEQ ID:788, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27453] Another function of GAM180 is therefore inhibition of LOC142941 (Accession XP_096363.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC142941.

[27454] LOC143310 (Accession XP_084485.1) is another GAM180 target gene, herein designated TARGET GENE. LOC143310 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC143310, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC143310 BINDING SITE, designated SEQ ID:10414, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27455] Another function of GAM180 is therefore inhibition of

LOC143310 (Accession XP_084485.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143310.

[27456] LOC143916 (Accession XP_084664.1) is another GAM180 target gene, herein designated TARGET GENE. LOC143916 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC143916, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC143916 BINDING SITE, designated SEQ ID:7055, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27457] Another function of GAM180 is therefore inhibition of LOC143916 (Accession XP_084664.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143916.

[27458] LOC144017 (Accession XP_096520.1) is another GAM180 target gene, herein designated TARGET GENE. LOC144017 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC144017, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144017 BINDING SITE, designated SEQ ID:2879, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27459] Another function of GAM180 is therefore inhibition of LOC144017 (Accession XP_096520.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144017.

[27460] LOC147804 (Accession XP_085901.1) is another GAM180 target gene, herein designated TARGET GENE. LOC147804 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC147804, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147804 BINDING SITE, designated SEQ ID:1554, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27461] Another function of GAM180 is therefore inhibition of LOC147804 (Accession XP_085901.1) . Accordingly, utili-

ties of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147804.

[27462] LOC147975 (Accession XP_097351.2) is another GAM180 target gene, herein designated TARGET GENE. LOC147975 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC147975, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147975 BINDING SITE, designated SEQ ID:19458, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27463] Another function of GAM180 is therefore inhibition of LOC147975 (Accession XP_097351.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147975.

[27464] LOC148490 (Accession XP_086210.2) is another GAM180 target gene, herein designated TARGET GENE. LOC148490 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC148490, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148490 BINDING SITE, designated SEQ ID:16289, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27465] Another function of GAM180 is therefore inhibition of LOC148490 (Accession XP_086210.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148490.

[27466] LOC150225 (Accession XP_097870.1) is another GAM180 target gene, herein designated TARGET GENE. LOC150225 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150225, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150225 BINDING SITE, designated SEQ ID:18952, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27467] Another function of GAM180 is therefore inhibition of LOC150225 (Accession XP_097870.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC150225.

[27468] LOC150776 (Accession XP_032542.1) is another GAM180 target gene, herein designated TARGET GENE. LOC150776 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150776, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150776 BINDING SITE, designated SEQ ID:1321, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27469] Another function of GAM180 is therefore inhibition of LOC150776 (Accession XP_032542.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150776.

[27470] LOC151568 (Accession NP_612492.1) is another GAM180 target gene, herein designated TARGET GENE. LOC151568 BINDING SITE1 and LOC151568 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC151568, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING

SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151568 BINDING SITE1 and LOC151568 BINDING SITE2, designated SEQ ID:15467 and SEQ ID:5239 respectively, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27471] Another function of GAM180 is therefore inhibition of LOC151568 (Accession NP_612492.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151568.

[27472] LOC152445 (Accession XP_098231.1) is another GAM180 target gene, herein designated TARGET GENE. LOC152445 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC152445, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152445 BINDING SITE, designated SEQ ID:10081, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27473] Another function of GAM180 is therefore inhibition of LOC152445 (Accession XP_098231.1) . Accordingly, utili-

ties of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152445.

[27474] LOC162083 (Accession XP_091339.2) is another GAM180 target gene, herein designated TARGET GENE. LOC162083 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC162083, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC162083 BINDING SITE, designated SEQ ID:9824, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27475] Another function of GAM180 is therefore inhibition of LOC162083 (Accession XP_091339.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162083.

[27476] LOC164091 (Accession XP_089356.1) is another GAM180 target gene, herein designated TARGET GENE. LOC164091 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC164091, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC164091 BINDING SITE, designated SEQ ID:7693, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27477] Another function of GAM180 is therefore inhibition of LOC164091 (Accession XP_089356.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164091.

[27478] LOC165257 (Accession XP_092478.3) is another GAM180 target gene, herein designated TARGET GENE. LOC165257 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC165257, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC165257 BINDING SITE, designated SEQ ID:1432, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27479] Another function of GAM180 is therefore inhibition of LOC165257 (Accession XP_092478.3) . Accordingly, utilities of GAM180 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC165257.

[27480] LOC200609 (Accession XP_117256.1) is another GAM180 target gene, herein designated TARGET GENE. LOC200609 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC200609, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200609 BINDING SITE, designated SEQ ID:1876, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27481] Another function of GAM180 is therefore inhibition of LOC200609 (Accession XP_117256.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200609.

[27482] LOC201562 (Accession XP_114343.2) is another GAM180 target gene, herein designated TARGET GENE. LOC201562 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC201562, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC201562 BINDING SITE, designated SEQ ID:12642, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27483] Another function of GAM180 is therefore inhibition of LOC201562 (Accession XP_114343.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201562.

[27484] LOC219918 (Accession XP_166197.1) is another GAM180 target gene, herein designated TARGET GENE. LOC219918 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC219918, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC219918 BINDING SITE, designated SEQ ID:5660, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27485] Another function of GAM180 is therefore inhibition of LOC219918 (Accession XP_166197.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC219918.

[27486] LOC220071 (Accession XP_167848.1) is another GAM180 target gene, herein designated TARGET GENE. LOC220071 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC220071, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC220071 BINDING SITE, designated SEQ ID:5660, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27487] Another function of GAM180 is therefore inhibition of LOC220071 (Accession XP_167848.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220071.

[27488] LOC220758 (Accession XP_165466.1) is another GAM180 target gene, herein designated TARGET GENE. LOC220758 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC220758, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC220758 BINDING SITE, designated SEQ ID:1949, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27489] Another function of GAM180 is therefore inhibition of LOC220758 (Accession XP_165466.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220758.

[27490] LOC220763 (Accession XP_055551.1) is another GAM180 target gene, herein designated TARGET GENE. LOC220763 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC220763, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC220763 BINDING SITE, designated SEQ ID:5457, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27491] Another function of GAM180 is therefore inhibition of LOC220763 (Accession XP_055551.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220763.

[27492] LOC221584 (Accession XP_168132.1) is another GAM180 target gene, herein designated TARGET GENE. LOC221584 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC221584, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221584 BINDING SITE, designated SEQ ID:13096, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27493] Another function of GAM180 is therefore inhibition of LOC221584 (Accession XP_168132.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221584.

[27494] LOC253044 (Accession XP_172924.2) is another GAM180 target gene, herein designated TARGET GENE. LOC253044 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC253044, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC253044 BINDING SITE, designated SEQ ID:11944, to

the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27495] Another function of GAM180 is therefore inhibition of LOC253044 (Accession XP_172924.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253044.

[27496] LOC253263 (Accession XP_173102.1) is another GAM180 target gene, herein designated TARGET GENE. LOC253263 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC253263, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC253263 BINDING SITE, designated SEQ ID:12769, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27497] Another function of GAM180 is therefore inhibition of LOC253263 (Accession XP_173102.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253263.

[27498] LOC283038 (Accession XP_302599.1) is another GAM180

target gene, herein designated TARGET GENE. LOC283038 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283038, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283038 BINDING SITE, designated SEQ ID:4836, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27499] Another function of GAM180 is therefore inhibition of LOC283038 (Accession XP_302599.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283038.

[27500] LOC283087 (Accession XP_208509.1) is another GAM180 target gene, herein designated TARGET GENE. LOC283087 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283087, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283087 BINDING SITE, designated SEQ ID:7112, to the nucleotide sequence of GAM180 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:214.

[27501] Another function of GAM180 is therefore inhibition of LOC283087 (Accession XP_208509.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283087.

[27502] LOC283140 (Accession XP_210911.1) is another GAM180 target gene, herein designated TARGET GENE. LOC283140 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283140, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283140 BINDING SITE, designated SEQ ID:11320, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27503] Another function of GAM180 is therefore inhibition of LOC283140 (Accession XP_210911.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283140.

[27504] LOC283298 (Accession XP_208606.1) is another GAM180 target gene, herein designated TARGET GENE. LOC283298

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283298, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283298 BINDING SITE, designated SEQ ID:11643, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27505] Another function of GAM180 is therefore inhibition of LOC283298 (Accession XP_208606.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283298.

[27506] LOC283337 (Accession XP_300560.1) is another GAM180 target gene, herein designated TARGET GENE. LOC283337 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283337, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283337 BINDING SITE, designated SEQ ID:8912, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27507] Another function of GAM180 is therefore inhibition of LOC283337 (Accession XP_300560.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283337.

[27508] LOC283570 (Accession XP_211118.1) is another GAM180 target gene, herein designated TARGET GENE. LOC283570 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283570, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283570 BINDING SITE, designated SEQ ID:12808, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27509] Another function of GAM180 is therefore inhibition of LOC283570 (Accession XP_211118.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283570.

[27510] LOC283574 (Accession XP_211099.1) is another GAM180 target gene, herein designated TARGET GENE. LOC283574 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC283574, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283574 BINDING SITE, designated SEQ ID:1593, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27511] Another function of GAM180 is therefore inhibition of LOC283574 (Accession XP_211099.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283574.

[27512] LOC283810 (Accession XP_208853.1) is another GAM180 target gene, herein designated TARGET GENE. LOC283810 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283810, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283810 BINDING SITE, designated SEQ ID:3590, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27513] Another function of GAM180 is therefore inhibition of

LOC283810 (Accession XP_208853.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283810.

[27514] LOC283831 (Accession XP_211224.1) is another GAM180 target gene, herein designated TARGET GENE. LOC283831 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283831, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283831 BINDING SITE, designated SEQ ID:4669, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27515] Another function of GAM180 is therefore inhibition of LOC283831 (Accession XP_211224.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283831.

[27516] LOC283911 (Accession XP_211259.2) is another GAM180 target gene, herein designated TARGET GENE. LOC283911 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283911, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283911 BINDING SITE, designated SEQ ID:11417, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27517] Another function of GAM180 is therefore inhibition of LOC283911 (Accession XP_211259.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283911.

[27518] LOC283922 (Accession XP_208908.1) is another GAM180 target gene, herein designated TARGET GENE. LOC283922 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283922, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283922 BINDING SITE, designated SEQ ID:15803, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27519] Another function of GAM180 is therefore inhibition of LOC283922 (Accession XP_208908.1) . Accordingly, utili-

ties of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283922.

[27520] LOC283929 (Accession XP_208905.2) is another GAM180 target gene, herein designated TARGET GENE. LOC283929 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283929, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283929 BINDING SITE, designated SEQ ID:10481, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27521] Another function of GAM180 is therefore inhibition of LOC283929 (Accession XP_208905.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283929.

[27522] LOC283982 (Accession XP_208954.1) is another GAM180 target gene, herein designated TARGET GENE. LOC283982 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283982, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283982 BINDING SITE, designated SEQ ID:6204, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27523] Another function of GAM180 is therefore inhibition of LOC283982 (Accession XP_208954.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283982.

[27524] LOC284045 (Accession XP_210776.1) is another GAM180 target gene, herein designated TARGET GENE. LOC284045 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284045, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284045 BINDING SITE, designated SEQ ID:15106, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27525] Another function of GAM180 is therefore inhibition of LOC284045 (Accession XP_210776.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC284045.

[27526] LOC284220 (Accession XP_211391.1) is another GAM180 target gene, herein designated TARGET GENE. LOC284220 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284220, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284220 BINDING SITE, designated SEQ ID:16999, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27527] Another function of GAM180 is therefore inhibition of LOC284220 (Accession XP_211391.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284220.

[27528] LOC284360 (Accession XP_211433.1) is another GAM180 target gene, herein designated TARGET GENE. LOC284360 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284360, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC284360 BINDING SITE, designated SEQ ID:1154, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27529] Another function of GAM180 is therefore inhibition of LOC284360 (Accession XP_211433.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284360.

[27530] LOC284549 (Accession XP_211514.1) is another GAM180 target gene, herein designated TARGET GENE. LOC284549 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284549, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284549 BINDING SITE, designated SEQ ID:2382, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27531] Another function of GAM180 is therefore inhibition of LOC284549 (Accession XP_211514.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC284549.

[27532] LOC284585 (Accession XP_209277.2) is another GAM180 target gene, herein designated TARGET GENE. LOC284585 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284585, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284585 BINDING SITE, designated SEQ ID:1916, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27533] Another function of GAM180 is therefore inhibition of LOC284585 (Accession XP_209277.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284585.

[27534] LOC284773 (Accession XP_209353.1) is another GAM180 target gene, herein designated TARGET GENE. LOC284773 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284773, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284773 BINDING SITE, designated SEQ ID:16000, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27535] Another function of GAM180 is therefore inhibition of LOC284773 (Accession XP_209353.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284773.

[27536] LOC284947 (Accession XP_211705.1) is another GAM180 target gene, herein designated TARGET GENE. LOC284947 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284947, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284947 BINDING SITE, designated SEQ ID:11231, to

the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27537] Another function of GAM180 is therefore inhibition of LOC284947 (Accession XP_211705.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284947.

[27538] LOC285026 (Accession XP_209440.1) is another GAM180 target gene, herein designated TARGET GENE. LOC285026 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285026, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285026 BINDING SITE, designated SEQ ID:6831, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27539] Another function of GAM180 is therefore inhibition of LOC285026 (Accession XP_209440.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285026.

[27540] LOC285029 (Accession XP_211741.1) is another GAM180

target gene, herein designated TARGET GENE. LOC285029 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285029, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285029 BINDING SITE, designated SEQ ID:12677, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27541] Another function of GAM180 is therefore inhibition of LOC285029 (Accession XP_211741.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285029.

[27542] LOC285056 (Accession XP_208283.1) is another GAM180 target gene, herein designated TARGET GENE. LOC285056 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285056, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285056 BINDING SITE, designated SEQ ID:10528, to the nucleotide sequence of GAM180 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:214.

[27543] Another function of GAM180 is therefore inhibition of LOC285056 (Accession XP_208283.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285056.

[27544] LOC285286 (Accession XP_211834.1) is another GAM180 target gene, herein designated TARGET GENE. LOC285286 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285286, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285286 BINDING SITE, designated SEQ ID:555, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27545] Another function of GAM180 is therefore inhibition of LOC285286 (Accession XP_211834.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285286.

[27546] LOC285376 (Accession XP_211864.1) is another GAM180 target gene, herein designated TARGET GENE. LOC285376

BINDING SITE1 and LOC285376 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC285376, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285376 BINDING SITE1 and LOC285376 BINDING SITE2, designated SEQ ID:15389 and SEQ ID:1613 respectively, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27547] Another function of GAM180 is therefore inhibition of LOC285376 (Accession XP_211864.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285376.

[27548] LOC285786 (Accession XP_208349.1) is another GAM180 target gene, herein designated TARGET GENE. LOC285786 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285786, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285786 BINDING SITE, designated SEQ ID:7150, to

the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27549] Another function of GAM180 is therefore inhibition of LOC285786 (Accession XP_208349.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285786.

[27550] LOC285999 (Accession XP_212120.1) is another GAM180 target gene, herein designated TARGET GENE. LOC285999 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285999, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285999 BINDING SITE, designated SEQ ID:8264, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27551] Another function of GAM180 is therefore inhibition of LOC285999 (Accession XP_212120.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285999.

[27552] LOC338708 (Accession XP_294683.1) is another GAM180

target gene, herein designated TARGET GENE. LOC338708 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC338708, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338708 BINDING SITE, designated SEQ ID:17540, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27553] Another function of GAM180 is therefore inhibition of LOC338708 (Accession XP_294683.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338708.

[27554] LOC338987 (Accession XP_290664.1) is another GAM180 target gene, herein designated TARGET GENE. LOC338987 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC338987, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338987 BINDING SITE, designated SEQ ID:5719, to the nucleotide sequence of GAM180 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:214.

[27555] Another function of GAM180 is therefore inhibition of LOC338987 (Accession XP_290664.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338987.

[27556] LOC339186 (Accession XP_294845.1) is another GAM180 target gene, herein designated TARGET GENE. LOC339186 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339186, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339186 BINDING SITE, designated SEQ ID:11297, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27557] Another function of GAM180 is therefore inhibition of LOC339186 (Accession XP_294845.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339186.

[27558] LOC339240 (Accession XP_294880.1) is another GAM180 target gene, herein designated TARGET GENE. LOC339240

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339240, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339240 BINDING SITE, designated SEQ ID:11297, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27559] Another function of GAM180 is therefore inhibition of LOC339240 (Accession XP_294880.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339240.

[27560] LOC339258 (Accession XP_294886.1) is another GAM180 target gene, herein designated TARGET GENE. LOC339258 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339258, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339258 BINDING SITE, designated SEQ ID:11297, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27561] Another function of GAM180 is therefore inhibition of LOC339258 (Accession XP_294886.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339258.

[27562] LOC339751 (Accession XP_295053.1) is another GAM180 target gene, herein designated TARGET GENE. LOC339751 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339751, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339751 BINDING SITE, designated SEQ ID:9131, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27563] Another function of GAM180 is therefore inhibition of LOC339751 (Accession XP_295053.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339751.

[27564] LOC339899 (Accession XP_295096.1) is another GAM180 target gene, herein designated TARGET GENE. LOC339899 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC339899, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339899 BINDING SITE, designated SEQ ID:2376, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27565] Another function of GAM180 is therefore inhibition of LOC339899 (Accession XP_295096.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339899.

[27566] LOC340090 (Accession XP_295154.1) is another GAM180 target gene, herein designated TARGET GENE. LOC340090 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC340090, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340090 BINDING SITE, designated SEQ ID:13639, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27567] Another function of GAM180 is therefore inhibition of

LOC340090 (Accession XP_295154.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340090.

[27568] LOC342346 (Accession XP_296817.2) is another GAM180 target gene, herein designated TARGET GENE. LOC342346 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC342346, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC342346 BINDING SITE, designated SEQ ID:11373, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27569] Another function of GAM180 is therefore inhibition of LOC342346 (Accession XP_296817.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC342346.

[27570] LOC347546 (Accession XP_298101.2) is another GAM180 target gene, herein designated TARGET GENE. LOC347546 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC347546, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC347546 BINDING SITE, designated SEQ ID:3508, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27571] Another function of GAM180 is therefore inhibition of LOC347546 (Accession XP_298101.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC347546.

[27572] LOC347648 (Accession XP_300226.1) is another GAM180 target gene, herein designated TARGET GENE. LOC347648 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC347648, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC347648 BINDING SITE, designated SEQ ID:2916, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27573] Another function of GAM180 is therefore inhibition of LOC347648 (Accession XP_300226.1) . Accordingly, utili-

ties of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC347648.

[27574] LOC347884 (Accession XP_302617.1) is another GAM180 target gene, herein designated TARGET GENE. LOC347884 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC347884, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC347884 BINDING SITE, designated SEQ ID:5296, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27575] Another function of GAM180 is therefore inhibition of LOC347884 (Accession XP_302617.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC347884.

[27576] LOC348112 (Accession XP_302657.1) is another GAM180 target gene, herein designated TARGET GENE. LOC348112 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348112, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348112 BINDING SITE, designated SEQ ID:14248, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27577] Another function of GAM180 is therefore inhibition of LOC348112 (Accession XP_302657.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348112.

[27578] LOC348452 (Accession XP_300742.1) is another GAM180 target gene, herein designated TARGET GENE. LOC348452 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348452, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348452 BINDING SITE, designated SEQ ID:1711, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27579] Another function of GAM180 is therefore inhibition of LOC348452 (Accession XP_300742.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC348452.

[27580] LOC349094 (Accession XP_300945.1) is another GAM180 target gene, herein designated TARGET GENE. LOC349094 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349094, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349094 BINDING SITE, designated SEQ ID:7090, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27581] Another function of GAM180 is therefore inhibition of LOC349094 (Accession XP_300945.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349094.

[27582] LOC349097 (Accession XP_300940.1) is another GAM180 target gene, herein designated TARGET GENE. LOC349097 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349097, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC349097 BINDING SITE, designated SEQ ID:7090, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27583] Another function of GAM180 is therefore inhibition of LOC349097 (Accession XP_300940.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349097.

[27584] LOC349138 (Accession XP_300960.1) is another GAM180 target gene, herein designated TARGET GENE. LOC349138 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349138, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349138 BINDING SITE, designated SEQ ID:7090, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27585] Another function of GAM180 is therefore inhibition of LOC349138 (Accession XP_300960.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC349138.

[27586] LOC349305 (Accession XP_301019.1) is another GAM180 target gene, herein designated TARGET GENE. LOC349305 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349305, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349305 BINDING SITE, designated SEQ ID:1916, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27587] Another function of GAM180 is therefore inhibition of LOC349305 (Accession XP_301019.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349305.

[27588] LOC351228 (Accession XP_304390.1) is another GAM180 target gene, herein designated TARGET GENE. LOC351228 BINDING SITE1 through LOC351228 BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by LOC351228, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of LOC351228 BINDING SITE1 through LOC351228 BINDING SITE3, designated SEQ ID:1629, SEQ ID:17782 and SEQ ID:5030 respectively, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27589] Another function of GAM180 is therefore inhibition of LOC351228 (Accession XP_304390.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC351228.

[27590] LOC92235 (Accession XP_043739.2) is another GAM180 target gene, herein designated TARGET GENE. LOC92235 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC92235, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC92235 BINDING SITE, designated SEQ ID:11492, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27591] Another function of GAM180 is therefore inhibition of LOC92235 (Accession XP_043739.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC92235.

[27592] LOC92710 (Accession XP_046811.2) is another GAM180 target gene, herein designated TARGET GENE. LOC92710 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC92710, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC92710 BINDING SITE, designated SEQ ID:17389, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27593] Another function of GAM180 is therefore inhibition of LOC92710 (Accession XP_046811.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92710.

[27594] Lymphocyte antigen 6 complex, locus h (LY6H, Accession NP_002338.1) is another GAM180 target gene, herein designated TARGET GENE. LY6H BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LY6H, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LY6H BINDING SITE, designated SEQ ID:16930, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27595] Another function of GAM180 is therefore inhibition of Lymphocyte antigen 6 complex, locus h (LY6H, Accession NP_002338.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LY6H.

[27596] Lysophospholipase 3 (lysosomal phospholipase a2) (LYPLA3, Accession NP_036452.1) is another GAM180 target gene, herein designated TARGET GENE. LYPLA3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LYPLA3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LYPLA3 BINDING SITE, designated SEQ ID:10576, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27597] Another function of GAM180 is therefore inhibition of Lysophospholipase 3 (lysosomal phospholipase a2)

(LYPLA3, Accession NP_036452.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LY-PLA3.

[27598] MGC10334 (Accession XP_300761.1) is another GAM180 target gene, herein designated TARGET GENE. MGC10334 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MGC10334, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC10334 BINDING SITE, designated SEQ ID:1711, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27599] Another function of GAM180 is therefore inhibition of MGC10334 (Accession XP_300761.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10334.

[27600] MGC10334 (Accession NP_085052.1) is another GAM180 target gene, herein designated TARGET GENE. MGC10334 BINDING SITE is a target binding site found in the 5` un-

translated region of multiple transcripts of mRNA encoded by MGC10334, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC10334 BINDING SITE, designated SEQ ID:1711, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27601] Another function of GAM180 is therefore inhibition of MGC10334 (Accession NP_085052.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10334.

[27602] MGC34680 (Accession NP_689559.1) is another GAM180 target gene, herein designated TARGET GENE. MGC34680 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC34680, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC34680 BINDING SITE, designated SEQ ID:4811, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27603] Another function of GAM180 is therefore inhibition of MGC34680 (Accession NP_689559.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC34680.

[27604] MGC40042 (Accession NP_689726.2) is another GAM180 target gene, herein designated TARGET GENE. MGC40042 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC40042, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC40042 BINDING SITE, designated SEQ ID:15660, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27605] Another function of GAM180 is therefore inhibition of MGC40042 (Accession NP_689726.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC40042.

[27606] MGC41906 (Accession NP_689687.1) is another GAM180 target gene, herein designated TARGET GENE. MGC41906 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by MGC41906, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC41906 BINDING SITE, designated SEQ ID:5085, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27607] Another function of GAM180 is therefore inhibition of MGC41906 (Accession NP_689687.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC41906.

[27608] MGC4767 (Accession NP_115690.1) is another GAM180 target gene, herein designated TARGET GENE. MGC4767 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC4767, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC4767 BINDING SITE, designated SEQ ID:8947, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27609] Another function of GAM180 is therefore inhibition of

MGC4767 (Accession NP_115690.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4767.

[27610] MPRA (Accession NP_848509.1) is another GAM180 target gene, herein designated TARGET GENE. MPRA BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MPRA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MPRA BINDING SITE, designated SEQ ID:7693, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27611] Another function of GAM180 is therefore inhibition of MPRA (Accession NP_848509.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPRA.

[27612] Membrane-spanning 4-domains, subfamily a, member 6a (MS4A6A, Accession NP_690590.1) is another GAM180 target gene, herein designated TARGET GENE. MS4A6A BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded

by MS4A6A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MS4A6A BINDING SITE, designated SEQ ID:14166, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27613] Another function of GAM180 is therefore inhibition of Membrane-spanning 4-domains, subfamily a, member 6a (MS4A6A, Accession NP_690590.1), a gene which binds to the fc region of immunoglobulins epsilon. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MS4A6A.

[27614] The function of MS4A6A has been established by previous studies. By EST database searching for homologs of CD20 (MS4A1; 112210), Ishibashi et al. (2001) isolated a cDNA encoding MS4A6A, which they termed MS4A6. The deduced 178- amino acid protein has 4 potential phosphorylation sites, including 1 at the intracellular loop, and a nonhydrophilic C terminus. Northern blot analysis revealed low- level expression of a 1.3- kb transcript in mouse kidney and small intestine and a 1.0- kb transcript

in mouse heart; no expression was detected in human tissues. Liang and Tedder (2001) also obtained a cDNA encoding MS4A6A. The predicted 248- amino acid protein is more than 50% identical to its mouse homologs. PCR analysis detected variable expression of MS4A6A in cDNA from some B- cell, myelomonocytic, and erythroleukemia cell lines. The authors identified likely polymorphisms in the MS4A6A gene.

[27615]

[27616] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27617] Ishibashi, K.; Suzuki, M.; Sasaki, S.; Imai, M. : Identification of a new multigene four- transmembrane family (MS4A) related to CD20, HTm4 and beta subunit of the high- affinity IgE receptor. Gene 264: 87- 93, 2001. ; and

[27618] Liang, Y.; Tedder, T. F. : Identification of a CD20-, Fc- epsilon- RI- beta- related gene family: sixteen new MS4A family members expressed in human and mouse. Genomics 72: 119- 127, 2001.

[27619] Further studies establishing the function and utilities of MS4A6A are found in John Hopkins OMIM database record ID 606548, and in cited publications listed in Table 5,

which are hereby incorporated by reference.Membrane-spanning 4-domains, subfamily a, member 6a (MS4A6A, Accession NP_690591.1) is another GAM180 target gene, herein designated TARGET GENE. MS4A6A BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MS4A6A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MS4A6A BINDING SITE, designated SEQ ID:14166, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27620] Another function of GAM180 is therefore inhibition of Membrane-spanning 4-domains, subfamily a, member 6a (MS4A6A, Accession NP_690591.1), a gene which binds to the fc region of immunoglobulins epsilon. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MS4A6A.

[27621] The function of MS4A6A has been established by previous studies. By EST database searching for homologs of CD20 (MS4A1; 112210), Ishibashi et al. (2001) isolated a cDNA

encoding MS4A6A, which they termed MS4A6. The deduced 178- amino acid protein has 4 potential phosphorylation sites, including 1 at the intracellular loop, and a nonhydrophilic C terminus. Northern blot analysis revealed low- level expression of a 1.3- kb transcript in mouse kidney and small intestine and a 1.0- kb transcript in mouse heart; no expression was detected in human tissues. Liang and Tedder (2001) also obtained a cDNA encoding MS4A6A. The predicted 248- amino acid protein is more than 50% identical to its mouse homologs. PCR analysis detected variable expression of MS4A6A in cDNA from some B- cell, myelomonocytic, and erythroleukemia cell lines. The authors identified likely polymorphisms in the MS4A6A gene.

[27622]

[27623] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27624] Ishibashi, K.; Suzuki, M.; Sasaki, S.; Imai, M. : Identification of a new multigene four- transmembrane family (MS4A) related to CD20, HTm4 and beta subunit of the high- affinity IgE receptor. Gene 264: 87- 93, 2001. ; and

[27625] Liang, Y.; Tedder, T. F. : Identification of a CD20-, Fc- ep-

silon- RI- beta- related gene family: sixteen new MS4A family members expressed in human and mouse. Genomics 72: 119- 127, 2001.

[27626] Further studies establishing the function and utilities of MS4A6A are found in John Hopkins OMIM database record ID 606548, and in cited publications listed in Table 5, which are hereby incorporated by reference.NCAG1 (Accession NP_115536.1) is another GAM180 target gene, herein designated TARGET GENE. NCAG1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NCAG1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NCAG1 BINDING SITE, designated SEQ ID:18626, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27627] Another function of GAM180 is therefore inhibition of NCAG1 (Accession NP_115536.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCAG1.

[27628] NET-7 (Accession NP_036471.1) is another GAM180 target gene, herein designated TARGET GENE. NET-7 BIND-

ING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NET-7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NET-7 BINDING SITE, designated SEQ ID:11703, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27629] Another function of GAM180 is therefore inhibition of NET-7 (Accession NP_036471.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NET-7.

[27630] Nuclear factor i/b (NFIB, Accession NP_005587.1) is another GAM180 target gene, herein designated TARGET GENE. NFIB BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NFIB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NFIB BINDING SITE, designated SEQ ID:13925, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27631] Another function of GAM180 is therefore inhibition of Nu-

clear factor i/b (NFIB, Accession NP_005587.1), a gene which recognizes and binds the palindromic sequence 5'-ttggcnnnnngccaa- 3' present in viral and cellular promoters. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFIB.

[27632] The function of NFIB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM94.1.NMNAT2 (Accession NP_055854.1) is another GAM180 target gene, herein designated TARGET GENE. NMNAT2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by NMNAT2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NMNAT2 BINDING SITE, designated SEQ ID:8057, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27633] Another function of GAM180 is therefore inhibition of NMNAT2 (Accession NP_055854.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with NM-NAT2.

[27634] Nitric oxide synthase 1 (neuronal) (NOS1, Accession NP_000611.1) is another GAM180 target gene, herein designated TARGET GENE. NOS1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NOS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NOS1 BINDING SITE, designated SEQ ID:17856, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27635] Another function of GAM180 is therefore inhibition of Nitric oxide synthase 1 (neuronal) (NOS1, Accession NP_000611.1), a gene which produces nitric oxide (no) which is a messenger molecule with diverse functions throughout the body. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NOS1.

[27636] The function of NOS1 has been established by previous studies. Bredt et al. (1991) cloned a cDNA for the neuronal form of nitric oxide (NO) synthase and studied its expres-

sion. The only mammalian protein with close sequence similarity was cytochrome P450 reductase. Magee et al. (1996) used PCR to clone a novel form of neuronal NOS from rat penile RNA. This NOS cDNA was termed PnNOS for 'penile neuronal NOS.' Sequencing revealed that the PnNOS cDNA was identical to rat cerebellar neuronal NOS1 except for a 102- bp insertion in PnNOS, indicating that PnNOS is a novel isoform. PCR of a human penile cDNA library confirmed that this insert is present in human DNA at the same location. Repetition of RT- PCR showed PnNOS to be the only form of NOS1 expressed in rat penis, urethra, prostate, and skeletal muscle. The PnNOS form was also present in rat cerebellum, liver, and pelvic plexus, although less abundantly than the shorter isoform. The authors postulated that PnNOS may be responsible for the synthesis of nitric oxide during penile erection and may be involved in control of the tone of the urethra, prostate, and bladder.

[27637] Animal model experiments lend further support to the function of NOS1. Mice with targeted disruption of neuronal NO synthase display grossly normal appearance, locomotor activity, breeding, long- term potentiation, and long- term depression. NOS1- deficient mice are resistant

to neural stroke damage following middle cerebral artery ligation. Nelson et al. (1995) reported a large increase in aggressive behavior and excessive, inappropriate sexual behavior in NOS1 'knockout' mice. Initial observations indicated that male NOS1- deficient mice engaged in chronic aggressive behavior, not apparent among NOS1-deficient female mice or wildtype male or female mice housed together. Relevance of the observations to human behavior was suggested.

[27638] It is appreciated that the abovementioned animal model for NOS1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[27639] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27640] Magee, T.; Fuentes, A. M.; Garban, H.; Rajavashisth, T.; Marquez, D.; Rodriguez, J. A.; Rajfer, J.; Gonzalez- Cadavid, N. F. : Cloning of a novel neuronal nitric oxide synthase expressed in penis and lower urinary tract. Biochem. Biophys. Res. Commun. 226: 145- 151, 1996. ; and

[27641] Nelson, R. J.; Demas, G. E.; Huang, P. L.; Fishman, M. C.; Dawson, V. L.; Dawson, T. M.; Snyder, S. H. : Behavioural

abnormalities in male mice lacking neuronal nitric oxide synthase. N.

[27642] Further studies establishing the function and utilities of NOS1 are found in John Hopkins OMIM database record ID 163731, and in cited publications listed in Table 5, which are hereby incorporated by reference.Natriuretic peptide receptor c/guanylate cyclase c (atrionatriuretic peptide receptor c) (NPR3, Accession NP_000899.1) is another GAM180 target gene, herein designated TARGET GENE. NPR3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NPR3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NPR3 BINDING SITE, designated SEQ ID:9247, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27643] Another function of GAM180 is therefore inhibition of Natriuretic peptide receptor c/guanylate cyclase c (atrionatriuretic peptide receptor c) (NPR3, Accession NP_000899.1), a gene which is required for timing of endochondral ossification. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with NPR3.

[27644] The function of NPR3 has been established by previous studies. Using a bovine ANP C- type receptor cDNA as a hybridization probe, Porter et al. (1990) cloned cDNA encoding the human atrial natriuretic peptide clearance receptor (ANPRC; gene symbol = NPR3) from human placental and kidney cDNA libraries. The ANPC receptor mediates the internalization and metabolic clearance of ANP. The human sequence was shown to be highly homologous to the bovine sequence. Corresponding mRNA was expressed in human placenta, adult and fetal kidney, and fetal heart. Lowe et al. (1990) reported the sequence of the cDNA.

[27645] Animal model experiments lend further support to the function of NPR3. It is thought that atrial natriuretic peptide released from the heart in response to atrial stretch binds to a guanylyl cyclase- coupled receptor, which Lopez et al. (1995) symbolized GC- A, in the kidney to mediate natriuresis and diuresis, and to the same receptor in the vasculature to mediate relaxation. Lopez et al. (1995) reported that disruption of the GC- A gene by transfection of mouse embryonic stem cells resulted in mice with chronic elevations of blood pressure on a nor-

mal salt diet. Pressure was elevated by 27.4 mm Hg in homozygotes and 10.5 mm Hg in heterozygotes. Unexpectedly, the blood pressure remained elevated and unchanged in response to either minimal salt diet or high salt diet. Aldosterone and ANP concentrations were not affected by the genotype. Thus, the authors speculated that mutations in the receptor gene could explain some salt- resistant forms of essential hypertension in humans. Coupled with other work, this also suggested that the GC-A signaling pathway dominates at the level of peripheral resistance, where it can operate independently of ANP.

[27646] It is appreciated that the abovementioned animal model for NPR3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[27647] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27648] Lopez, M. J.; Wong, S. K.- F.; Kishimoto, I.; Dubois, S.; Mach, V.; Friesen, J.; Garbers, D. L.; Beuve, A. : Salt- resistant hypertension in mice lacking the guanylyl cyclase- A receptor for atrial natriuretic peptide. Nature 378: 65- 68, 1995. ; and

[27649] Porter, J. G.; Arfsten, A.; Fuller, F.; Miller, J. A.; Gregory, L. C.; Lewicki, J. A. : Isolation and functional expression of the human atrial natriuretic peptide clearance receptor c.

[27650] Further studies establishing the function and utilities of NPR3 are found in John Hopkins OMIM database record ID 108962, and in cited publications listed in Table 5, which are hereby incorporated by reference.NRLN1 (Accession NP_660277.1) is another GAM180 target gene, herein designated TARGET GENE. NRLN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NRLN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NRLN1 BINDING SITE, designated SEQ ID:15259, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27651] Another function of GAM180 is therefore inhibition of NRLN1 (Accession NP_660277.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRLN1.

[27652] Oxidative-stress responsive 1 (OSR1, Accession NP_660303.1) is another GAM180 target gene, herein

designated TARGET GENE. OSR1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by OSR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OSR1 BINDING SITE, designated SEQ ID:18887, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27653] Another function of GAM180 is therefore inhibition of Oxidative-stress responsive 1 (OSR1, Accession NP_660303.1), a gene which mediats stress- activated signals. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSR1.

[27654] The function of OSR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM133.1.P8 (Accession NP_036517.1) is another GAM180 target gene, herein designated TARGET GENE. P8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by P8, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of P8 BINDING SITE, designated SEQ ID:9958, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27655] Another function of GAM180 is therefore inhibition of P8 (Accession NP_036517.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P8.

[27656] Phosphodiesterase 8b (PDE8B, Accession NP_003710.1) is another GAM180 target gene, herein designated TARGET GENE. PDE8B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PDE8B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDE8B BINDING SITE, designated SEQ ID:17979, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27657] Another function of GAM180 is therefore inhibition of Phosphodiesterase 8b (PDE8B, Accession NP_003710.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with PDE8B.

[27658] Peroxisome biogenesis factor 10 (PEX10, Accession NP_722540.1) is another GAM180 target gene, herein designated TARGET GENE. PEX10 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PEX10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PEX10 BINDING SITE, designated SEQ ID:13341, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27659] Another function of GAM180 is therefore inhibition of Peroxisome biogenesis factor 10 (PEX10, Accession NP_722540.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEX10.

[27660] Peroxisome biogenesis factor 10 (PEX10, Accession NP_002608.1) is another GAM180 target gene, herein designated TARGET GENE. PEX10 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PEX10, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PEX10 BINDING SITE, designated SEQ ID:13341, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27661] Another function of GAM180 is therefore inhibition of Peroxisome biogenesis factor 10 (PEX10, Accession NP_002608.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEX10.

[27662] Prefoldin 5 (PFDN5, Accession NP_665903.1) is another GAM180 target gene, herein designated TARGET GENE. PFDN5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PFDN5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PFDN5 BINDING SITE, designated SEQ ID:11809, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27663] Another function of GAM180 is therefore inhibition of Prefoldin 5 (PFDN5, Accession NP_665903.1) . Accord-

ingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PFDN5.

[27664] Paraneoplastic antigen ma2 (PNMA2, Accession NP_009188.1) is another GAM180 target gene, herein designated TARGET GENE. PNMA2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PNMA2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PNMA2 BINDING SITE, designated SEQ ID:10910, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27665] Another function of GAM180 is therefore inhibition of Paraneoplastic antigen ma2 (PNMA2, Accession NP_009188.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PNMA2.

[27666] Protein phosphatase 1f (pp2c domain containing) (PPM1F, Accession NP_055449.1) is another GAM180 target gene, herein designated TARGET GENE. PPM1F BINDING SITE is a target binding site found in the 3` untranslated region of

mRNA encoded by PPM1F, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPM1F BINDING SITE, designated SEQ ID:5913, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27667] Another function of GAM180 is therefore inhibition of Protein phosphatase 1f (pp2c domain containing) (PPM1F, Accession NP_055449.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPM1F.

[27668] Protein phosphatase 1, regulatory (inhibitor) subunit 1b (dopamine and camp regulated phosphoprotein, darpp-32) (PPP1R1B, Accession NP_852606.1) is another GAM180 target gene, herein designated TARGET GENE. PPP1R1B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PPP1R1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPP1R1B BINDING SITE, designated SEQ ID:8599, to the nucleotide sequence of

GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27669] Another function of GAM180 is therefore inhibition of Protein phosphatase 1, regulatory (inhibitor) subunit 1b (dopamine and camp regulated phosphoprotein, darpp-32) (PPP1R1B, Accession NP_852606.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R1B.

[27670] Protein phosphatase 1, regulatory (inhibitor) subunit 1b (dopamine and camp regulated phosphoprotein, darpp-32) (PPP1R1B, Accession NP_115568.2) is another GAM180 target gene, herein designated TARGET GENE. PPP1R1B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PPP1R1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPP1R1B BINDING SITE, designated SEQ ID:8599, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27671] Another function of GAM180 is therefore inhibition of

Protein phosphatase 1, regulatory (inhibitor) subunit 1b (dopamine and camp regulated phosphoprotein, darpp-32) (PPP1R1B, Accession NP_115568.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R1B.

[27672] PRO2086 (Accession NP_054830.1) is another GAM180 target gene, herein designated TARGET GENE. PRO2086 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PRO2086, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO2086 BINDING SITE, designated SEQ ID:15425, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27673] Another function of GAM180 is therefore inhibition of PRO2086 (Accession NP_054830.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2086.

[27674] Periaxin (PRX, Accession NP_066007.1) is another GAM180 target gene, herein designated TARGET GENE.

PRX BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRX, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRX BINDING SITE, designated SEQ ID:15552, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27675] Another function of GAM180 is therefore inhibition of Periaxin (PRX, Accession NP_066007.1), a gene which seems to be required for maintenance of peripheral nerve myelin sheath. may have a role in axon- glial interactions, possibly by interacting with the cytoplasmic domains of integral membrane proteins such as myelin- associated glycoprotein in the periaxonal regions of the schwann cell plasma membrane. may have a role in the early phases of myelin deposition and therefore is associated with Dejerine- sottas neuropathy, autosomal recessive. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of Dejerine- sottas neuropathy, autosomal recessive, and of other diseases and clinical conditions associated with PRX.

[27676] The function of PRX and its association with various dis-

eases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Proline-serine-threonine phosphatase interacting protein 1 (PSTPIP1, Accession NP_003969.2) is another GAM180 target gene, herein designated TARGET GENE. PSTPIP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PSTPIP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PSTPIP1 BINDING SITE, designated SEQ ID:1021, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27677] Another function of GAM180 is therefore inhibition of Proline-serine-threonine phosphatase interacting protein 1 (PSTPIP1, Accession NP_003969.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSTPIP1.

[27678] Rab17, member ras oncogene family (RAB17, Accession NP_071894.1) is another GAM180 target gene, herein designated TARGET GENE. RAB17 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by RAB17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAB17 BINDING SITE, designated SEQ ID:17352, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27679] Another function of GAM180 is therefore inhibition of Rab17, member ras oncogene family (RAB17, Accession NP_071894.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB17.

[27680] Retinoic acid induced 14 (RAI14, Accession NP_056392.1) is another GAM180 target gene, herein designated TARGET GENE. RAI14 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAI14, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAI14 BINDING SITE, designated SEQ ID:15321, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27681] Another function of GAM180 is therefore inhibition of Retinoic acid induced 14 (RAI14, Accession NP_056392.1), a gene which is required for protein transport from the er to the golgi complex. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI14.

[27682] The function of RAI14 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Retinal degeneration, slow (retinitis pigmentosa 7) (RDS, Accession NP_000313.1) is another GAM180 target gene, herein designated TARGET GENE. RDS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RDS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RDS BINDING SITE, designated SEQ ID:14017, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27683] Another function of GAM180 is therefore inhibition of Retinal degeneration, slow (retinitis pigmentosa 7) (RDS, Accession NP_000313.1), a gene which may function as an

adhesion molecule involved in stabilization and compaction of outer segment disks or in the maintenance of the curvature of the rim and therefore is associated with Autosomal dominant retinitis pigmentosa. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of Autosomal dominant retinitis pigmentosa, and of other diseases and clinical conditions associated with RDS.

[27684] The function of RDS has been established by previous studies. Kohl et al. (1997) screened 76 independent families with various forms of mostly central retinal dystrophies for mutations in the RDS gene. Two nonsense mutations, 5 missense mutations, and 1 single base insertion were detected. All of these were in heterozygous state. Kohl et al. (1997) commented on the remarkable variation in phenotype and disease expression between and within families.

[27685] Animal model experiments lend further support to the function of RDS. A common feature of peripherin- related retinitis pigmentosa and macular dystrophy in the human and the rds mutation in mouse is the loss of photoreceptor function. It is characterized by complete failure to develop photoreceptor discs and outer segments, downreg-

ulation of rhodopsin (OMIM Ref. No. 180380), and apoptotic loss of photoreceptor cells. Ali et al. (2000) demonstrated that subretinal injection of recombinant adeno-associated virus encoding a Prph2 transgene resulted in stable generation of outer segment structures and formation of new stacks of discs containing both peripherin- 2 and rhodopsin, which in many cases were morphologically similar to normal outer segments. Moreover, the reestablishment of the structural integrity of the photoreceptor layer resulted in electrophysiologic correction. These studies demonstrated for the first time that a complex ultrastructural cell defect can be corrected both morphologically and functionally by in vivo gene transfer. Sarra et al. (2001) extended the analysis and demonstrated that the potential for ultrastructural improvement is dependent upon the age at which animals are treated, but the effect of a single injection on photoreceptor ultrastructure may be long- term. However, there was no significant effect on photoreceptor cell loss, irrespective of the date of administration, despite the improvements in morphology and function. These findings suggested that successful gene therapy in patients with photoreceptor defects may ultimately depend upon intervention in early stages of dis-

ease and upon accurate control of transgene expression.

[27686] It is appreciated that the abovementioned animal model for RDS is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[27687] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27688] Kohl, S.; Christ- Adler, M.; Apfelstedt- Sylla, E.; Kellner, U.; Eckstein, A.; Zrenner, E.; Wissinger, B. : RDS/peripherin gene mutations are frequent causes of central retinal dystrophies. J. Med. Genet. 34: 620- 626, 1997. ; and

[27689] Sarra, G.- M.; Stephens, C.; de Alwis, M.; Bainbridge, J. W. B.; Smith, A. J.; Thrasher, A. J.; Ali, R. R. : Gene replacement therapy in the retinal degeneration slow (rds) mouse: the ef.

[27690] Further studies establishing the function and utilities of RDS are found in John Hopkins OMIM database record ID 179605, and in cited publications listed in Table 5, which are hereby incorporated by reference.Arginine-glutamic acid dipeptide (re) repeats (RERE, Accession NP_036234.2) is another GAM180 target gene, herein designated TARGET GENE. RERE BINDING SITE is a target binding site

found in the 3` untranslated region of mRNA encoded by RERE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RERE BINDING SITE, designated SEQ ID:1004, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27691] Another function of GAM180 is therefore inhibition of Arginine-glutamic acid dipeptide (re) repeats (RERE, Accession NP_036234.2), a gene which binds DRPLA and locates in the nucleus and therefore may be associated with Dentatorubral- pallidoluysian atrophy. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of Dentatorubral- pallidoluysian atrophy, and of other diseases and clinical conditions associated with RERE.

[27692] The function of RERE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.Rhesus blood group, c glycoprotein (RHCG, Accession NP_057405.1) is another GAM180 target gene, herein designated TARGET GENE. RHCG BINDING SITE is a target binding site found in the 3` untranslated region of

mRNA encoded by RHCG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RHCG BINDING SITE, designated SEQ ID:9363, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27693] Another function of GAM180 is therefore inhibition of Rhesus blood group, c glycoprotein (RHCG, Accession NP_057405.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RHCG.

[27694] RNAHP (Accession NP_031398.1) is another GAM180 target gene, herein designated TARGET GENE. RNAHP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RNAHP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RNAHP BINDING SITE, designated SEQ ID:13198, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27695] Another function of GAM180 is therefore inhibition of

RNAHP (Accession NP_031398.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNAHP.

[27696] RODH-4 (Accession NP_003699.2) is another GAM180 target gene, herein designated TARGET GENE. RODH-4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RODH-4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RODH-4 BINDING SITE, designated SEQ ID:8216, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27697] Another function of GAM180 is therefore inhibition of RODH-4 (Accession NP_003699.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RODH-4.

[27698] Sal-like 2 (drosophila) (SALL2, Accession XP_300608.1) is another GAM180 target gene, herein designated TARGET GENE. SALL2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SALL2, corresponding to a target binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SALL2 BINDING SITE, designated SEQ ID:12473, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27699] Another function of GAM180 is therefore inhibition of Sal-like 2 (drosophila) (SALL2, Accession XP_300608.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SALL2.

[27700] SBP1 (Accession NP_835222.1) is another GAM180 target gene, herein designated TARGET GENE. SBP1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SBP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SBP1 BINDING SITE, designated SEQ ID:19335, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27701] Another function of GAM180 is therefore inhibition of SBP1 (Accession NP_835222.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with SBP1.

[27702] SDNSF (Accession NP_644808.1) is another GAM180 target gene, herein designated TARGET GENE. SDNSF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SDNSF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SDNSF BINDING SITE, designated SEQ ID:5177, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27703] Another function of GAM180 is therefore inhibition of SDNSF (Accession NP_644808.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDNSF.

[27704] Serum deprivation response (phosphatidylserine binding protein) (SDPR, Accession NP_004648.1) is another GAM180 target gene, herein designated TARGET GENE. SDPR BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SDPR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

SDPR BINDING SITE, designated SEQ ID:5176, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27705] Another function of GAM180 is therefore inhibition of Serum deprivation response (phosphatidylserine binding protein) (SDPR, Accession NP_004648.1), a gene which substrate for protein_kinase_C (assists in localizing PKC to invaginations of the plasma membrane. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDPR.

[27706] The function of SDPR has been established by previous studies. Gustincich et al. (1999) cloned SDPR from a human liver cDNA library using the murine homolog cloned by Gustincich and Schneider (1993) as probe. The SDPR cDNA encodes a deduced 425- amino acid peptide with a calculated molecular mass of 47.2 kD. The human and mouse proteins share 84% sequence identity; both contain a leucine zipper- like domain with 7 repeats and 2 putative protein kinase C phosphorylation sites. Northern blot analysis of various human tissues showed nearly ubiquitous expression of a 3.1- kb transcript, which was always coexpressed with a shorter transcript. Highest expression

was detected in heart and lung. Gustincich et al. (1999) also found that SDPR mRNA was detectable in asynchronously growing human fibroblast cells and was significantly upregulated after serum deprivation but not after density- dependent growth inhibition. Gustincich et al. (1999) determined that SDPR is the same as PS- p68, a phosphatidylserine- binding protein purified from human platelets by Burgener et al. (1990). SDPR localizes to the cytoplasm (Burgener et al., 1990; Gustincich et al., 1999). Using in vitro translation of histidine- tagged recombinant SDPR, Gustincich et al. (1999) found that SDPR is able to bind PS liposomes in a calcium- independent manner. Burgener et al. (1990) identified SDPR as the major PS-binding protein in platelets. They also found that SDPR was able to bind PKC in a cell- free assay in the presence of PS and calcium, resulting in SDPR phosphorylation.

[27707]

[27708] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27709] Burgener, R.; Wolf, M.; Ganz, T.; Baggiolini, M. : Purification and characterization of a major phosphatidylserine-binding phosphoprotein from human platelets. Biochem. J.

269: 729- 734, 1990. ; and

[27710] Gustincich, S.; Vatta, P.; Goruppi, S.; Wolf, M.; Saccone, S.; Della Valle, G.; Baggiolini, M.; Schneider, C. : The human serum deprivation response gene (SDPR) maps to 2q32-q33 and cod.

[27711] Further studies establishing the function and utilities of SDPR are found in John Hopkins OMIM database record ID 606728, and in cited publications listed in Table 5, which are hereby incorporated by reference.Solute carrier family 16 (monocarboxylic acid transporters), member 10 (SLC16A10, Accession NP_061063.2) is another GAM180 target gene, herein designated TARGET GENE. SLC16A10 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SLC16A10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC16A10 BINDING SITE, designated SEQ ID:2213, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27712] Another function of GAM180 is therefore inhibition of Solute carrier family 16 (monocarboxylic acid transporters), member 10 (SLC16A10, Accession NP_061063.2) . Ac-

cordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC16A10.

[27713] Solute carrier family 4, sodium bicarbonate transporter-like, member 10 (SLC4A10, Accession NP_071341.1) is another GAM180 target gene, herein designated TARGET GENE. SLC4A10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC4A10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC4A10 BINDING SITE, designated SEQ ID:7776, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27714] Another function of GAM180 is therefore inhibition of Solute carrier family 4, sodium bicarbonate transporter-like, member 10 (SLC4A10, Accession NP_071341.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC4A10.

[27715] Solute carrier family 4, sodium bicarbonate cotransporter, member 5 (SLC4A5, Accession NP_201580.2) is another GAM180 target gene, herein designated TARGET GENE.

SLC4A5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SLC4A5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC4A5 BINDING SITE, designated SEQ ID:15696, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27716] Another function of GAM180 is therefore inhibition of Solute carrier family 4, sodium bicarbonate cotransporter, member 5 (SLC4A5, Accession NP_201580.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC4A5.

[27717] Solute carrier family 5 (sodium/glucose cotransporter), member 2 (SLC5A2, Accession NP_003032.1) is another GAM180 target gene, herein designated TARGET GENE. SLC5A2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC5A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of SLC5A2 BINDING SITE, designated SEQ ID:3698, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27718] Another function of GAM180 is therefore inhibition of Solute carrier family 5 (sodium/glucose cotransporter), member 2 (SLC5A2, Accession NP_003032.1), a gene which is a sodium - glucose cotransporter. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC5A2.

[27719] The function of SLC5A2 has been established by previous studies. Wells et al. (1992) isolated from a human kidney library a cDNA with 59% amino acid similarity to intestinal Na+/glucose cotransporter (OMIM Ref. No. 182380) and with significant similarity to other members of the Na+/cotransporter family. Uptake experiments using cRNA- injected Xenopus oocytes showed specific uptake of glucose and alpha- methyl glucopyranoside at up to three times background. This uptake was saturable, suggesting that the cDNA corresponds to a low- affinity kidney sodium- glucose transporter. It was therefore referred to as sodium- glucose cotransporter 2, or SGLT2. By Southern blot analysis of genomic DNA from 16 somatic

cell hybrids, Wells et al. (1993) localized the SGLT2 gene to chromosome 16. Analysis of 3 additional hybrids that selectively retained all or part of human chromosome 16 demonstrated localization of the gene to 16p11.2. Kanai et al. (1994) characterized the previously cloned (Wells et al., 1992) human kidney cDNA that codes for a protein with 59% identity to the high affinity Na(+)/glucose co-transporter (SGLT1; 182380). Using expression studies with Xenopus laevis oocytes, they demonstrated that SGLT2 mediates saturable Na(+)- dependent and phlo-rizin- sensitive transport with K(m) values consistent with low affinity Na(+)/glucose cotransport. In contrast to SGLT1, SGLT2 does not transport D- galactose. Using combined in situ hybridization and immunocytochemistry with tubule segment specific marker antibodies, Kanai et al. (1994) demonstrated an extremely high level of SGLT2 message in proximal tubule S1 segments. This level of expression was also evident on Northern blots and likely confers the high capacity of this glucose transport system. Kanai et al. (1994) suggested that the defect in renal gly-cosuria (OMIM Ref. No. 233100) may reside in the SGLT2 gene.

[27720]

[27721] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27722] Wells, R. G.; Mohandas, T. K.; Hediger, M. A. : Localization of the Na+/glucose cotransporter gene SGLT2 to human chromosome 16 close to the centromere. Genomics 17: 787- 789, 1993. ; and

[27723] Kanai, Y.; Lee, W.- S.; You, G.; Brown, D.; Hediger, M. A. : The human kidney low affinity Na(+)/glucose cotransporter SGLT2: delineation of the major renal reabsorptive mechanism for D- gluc.

[27724] Further studies establishing the function and utilities of SLC5A2 are found in John Hopkins OMIM database record ID 182381, and in cited publications listed in Table 5, which are hereby incorporated by reference.Smith-magenis syndrome chromosome region, candidate 7 (SMCR7, Accession NP_631901.2) is another GAM180 target gene, herein designated TARGET GENE. SMCR7 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by SMCR7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of SMCR7 BINDING SITE, designated SEQ ID:15179, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27725] Another function of GAM180 is therefore inhibition of Smith-magenis syndrome chromosome region, candidate 7 (SMCR7, Accession NP_631901.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMCR7.

[27726] Smith-magenis syndrome chromosome region, candidate 7 (SMCR7, Accession NP_683684.1) is another GAM180 target gene, herein designated TARGET GENE. SMCR7 BINDING SITE is a target binding site found in the 5` un-translated region of multiple transcripts of mRNA encoded by SMCR7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-cleotide sequences of SMCR7 BINDING SITE, designated SEQ ID:15179, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27727] Another function of GAM180 is therefore inhibition of Smith-magenis syndrome chromosome region, candidate

7 (SMCR7, Accession NP_683684.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMCR7.

[27728] Small muscle protein, x-linked (SMPX, Accession NP_055147.1) is another GAM180 target gene, herein designated TARGET GENE. SMPX BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SMPX, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SMPX BINDING SITE, designated SEQ ID:15935, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27729] Another function of GAM180 is therefore inhibition of Small muscle protein, x-linked (SMPX, Accession NP_055147.1), a gene which is a novel X- chromosomal human gene. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMPX.

[27730] The function of SMPX has been established by previous studies. A wide range of techniques, including differential display, the 2- hybrid system, exon trapping, and recipro-

cal probing, have been applied to isolate human genes for basic functional analysis or as candidates for genetic disorders. In more recent times, large scale sequencing of both the human genome and a growing number of EST libraries has provided tools to improve gene identification. Patzak et al. (1999) studied a partial cDNA clone previously identified by reciprocal probing by Lee et al. (1995). By searching expressed and genomic databases, Patzak et al. (1999) identified 21 ESTs that allowed the assignment of a human extended consensus sequence of 887 bp, suggesting a completely expressed gene termed SMPX. By using the human consensus sequence, the orthologous mouse and rat Smpx genes could be aligned and confirmed by complete sequencing of additional SMPX- related clones obtained by library screening. The human and rodent SMPX genes encode proteins of 88 to 86 and 85 amino acids, respectively. The authors found that the SMPX gene consists of 5 exons and 4 introns, comprising together 52.1 kb. Northern blot analysis revealed that SMPX is preferentially and abundantly expressed in heart and skeletal muscle. By FISH, Patzak et al. (1999) mapped the SMPX gene close to marker DXS7101, 31.9 cM from the short arm telomere of the X chromosome at Xp22.1.

They confirmed this assignment by PCR on monochromosomal and subchromosomal mapping panels and by using the CEPH YAC library. The authors concluded that the expression and mapping data made SMPX a candidate for X-linked cardiac or muscle muscular disorders.

[27731]

[27732] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27733] Patzak, D.; Zhuchenko, O.; Lee, C.- C.; Wehnert, M. : Identification, mapping, and genomic structure of a novel X-chromosomal human gene (SMPX) encoding a small muscular protein. Hum. Genet. 105: 506- 512, 1999. ; and

[27734] Lee, C. C.; Yazdani, A.; Wehnert, M.; Zhao, Z. Y.; Lindsay, E. A.; Bailey, J.; Coolbaugh, M. I.; Couch, L.; Xiong, M.; Chinault, A. C.; Baldini, A.; Caskey, C. T. : Isolation of chromo.

[27735] Further studies establishing the function and utilities of SMPX are found in John Hopkins OMIM database record ID 300226, and in cited publications listed in Table 5, which are hereby incorporated by reference.Sclerosteosis (SOST, Accession NP_079513.1) is another GAM180 target gene, herein designated TARGET GENE. SOST BINDING SITE is a

target binding site found in the 3` untranslated region of mRNA encoded by SOST, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SOST BINDING SITE, designated SEQ ID:5377, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27736] Another function of GAM180 is therefore inhibition of Sclerosteosis (SOST, Accession NP_079513.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOST.

[27737] SPEC1 (Accession NP_064624.1) is another GAM180 target gene, herein designated TARGET GENE. SPEC1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SPEC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SPEC1 BINDING SITE, designated SEQ ID:8847, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27738] Another function of GAM180 is therefore inhibition of SPEC1 (Accession NP_064624.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPEC1.

[27739] Syntaxin 16 (STX16, Accession NP_003754.1) is another GAM180 target gene, herein designated TARGET GENE. STX16 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by STX16, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STX16 BINDING SITE, designated SEQ ID:8099, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27740] Another function of GAM180 is therefore inhibition of Syntaxin 16 (STX16, Accession NP_003754.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STX16.

[27741] Syntaxin 3a (STX3A, Accession NP_004168.1) is another GAM180 target gene, herein designated TARGET GENE. STX3A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by STX3A, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STX3A BINDING SITE, designated SEQ ID:15455, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27742] Another function of GAM180 is therefore inhibition of Syntaxin 3a (STX3A, Accession NP_004168.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STX3A.

[27743] Surfeit 5 (SURF5, Accession NP_852468.1) is another GAM180 target gene, herein designated TARGET GENE. SURF5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SURF5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SURF5 BINDING SITE, designated SEQ ID:4742, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27744] Another function of GAM180 is therefore inhibition of Surfeit 5 (SURF5, Accession NP_852468.1) . Accordingly,

utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SURF5.

[27745] Transcription factor 4 (TCF4, Accession NP_003190.1) is another GAM180 target gene, herein designated TARGET GENE. TCF4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TCF4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TCF4 BINDING SITE, designated SEQ ID:12785, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27746] Another function of GAM180 is therefore inhibition of Transcription factor 4 (TCF4, Accession NP_003190.1), a gene which is a transcriptional activator; interacts with ITF1 (TCF3); and contains basic helix- loop- helix domain. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF4.

[27747] The function of TCF4 has been established by previous studies. The high mobility group (HMG) box is a DNA-binding domain. TCF7 (OMIM Ref. No. 189908), also

called TCF1, and LEF1 (OMIM Ref. No. 153245), also called TCF1- alpha, are human lymphoid transcription factors that contain a virtually identical HMG box. By PCR of human genomic DNA using degenerate oligonucleotides based on the HMG boxes of TCF7 and LEF1, Castrop et al. (1992) identified the TCF7L1 (OMIM Ref. No. 604652) and TCF7L2 genes, which they called TCF3 and TCF4, respectively. TCF7L1 and TCF7L2 were not expressed in cells of the lymphoid lineage. The deduced amino acid sequences of the HMG boxes of TCF7L1, TCF7L2, and TCF7 show striking homology. The authors suggested the existence of a subfamily of TCF7- like HMG box- containing transcription factors.

[27748] Animal model experiments lend further support to the function of TCF4. To study the physiologic role of Tcf4 (which is encoded by the Tcf7l2 gene), Korinek et al. (1998) disrupted Tcf7l2 by homologous recombination. The homozygous null mice died shortly after birth. A single histopathologic abnormality was observed. An apparently normal transition of intestinal endoderm into epithelium occurred at approximately embryonic day (E) 14.5. However, no proliferative compartments were maintained in the prospective crypt regions between the villi.

As a consequence, the neonatal epithelium was composed entirely of differentiated, nondividing villus cells. Korinek et al. (1998) concluded that the genetic program controlled by Tcf7l2 maintains the crypt stem cells of the small intestine. The constitutive activity of Tcf4 in APC-deficient epithelial cells may contribute to their malignant transformation by maintaining stem cell characteristics.

[27749] It is appreciated that the abovementioned animal model for TCF4 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[27750] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27751] Castrop, J.; van Norren, K.; Clevers, H. : A gene family of HMG- box transcription factors with homology to TCF- 1. Nucleic Acids Res. 20: 611 only, 1992. ; and

[27752] Korinek, V.; Barker, N.; Moerer, P.; van Donselaar, E.; Huls, G.; Peters, P. J.; Clevers, H. : Depletion of epithelial stem-cell compartments in the small intestine of mice lacking Tcf- 4.

[27753] Further studies establishing the function and utilities of TCF4 are found in John Hopkins OMIM database record ID

602228, and in cited publications listed in Table 5, which are hereby incorporated by reference.Tgfb1-induced anti-apoptotic factor 1 (TIAF1, Accession NP_510880.2) is another GAM180 target gene, herein designated TARGET GENE. TIAF1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TIAF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TIAF1 BINDING SITE, designated SEQ ID:16174, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27754] Another function of GAM180 is therefore inhibition of Tgfb1-induced anti-apoptotic factor 1 (TIAF1, Accession NP_510880.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIAF1.

[27755] Transmembrane, prostate androgen induced rna (TMEPAI, Accession NP_064567.2) is another GAM180 target gene, herein designated TARGET GENE. TMEPAI BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TMEPAI, corresponding to a target

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TMEPAI BINDING SITE, designated SEQ ID:10288, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27756] Another function of GAM180 is therefore inhibition of Transmembrane, prostate androgen induced rna (TMEPAI, Accession NP_064567.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMEPAI.

[27757] Trinucleotide repeat containing 5 (TNRC5, Accession NP_006577.1) is another GAM180 target gene, herein designated TARGET GENE. TNRC5 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TNRC5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TNRC5 BINDING SITE, designated SEQ ID:1159, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27758] Another function of GAM180 is therefore inhibition of Trinucleotide repeat containing 5 (TNRC5, Accession

NP_006577.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNRC5.

[27759] Topoisomerase (dna) ii alpha 170kda (TOP2A, Accession NP_001058.2) is another GAM180 target gene, herein designated TARGET GENE. TOP2A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TOP2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TOP2A BINDING SITE, designated SEQ ID:12252, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27760] Another function of GAM180 is therefore inhibition of Topoisomerase (dna) ii alpha 170kda (TOP2A, Accession NP_001058.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOP2A.

[27761] TP53I11 (Accession XP_029347.6) is another GAM180 target gene, herein designated TARGET GENE. TP53I11 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by

TP53I11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TP53I11 BINDING SITE, designated SEQ ID:9520, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27762] Another function of GAM180 is therefore inhibition of TP53I11 (Accession XP_029347.6) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP53I11.

[27763] TRIAD3 (Accession NP_061884.2) is another GAM180 target gene, herein designated TARGET GENE. TRIAD3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TRIAD3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRIAD3 BINDING SITE, designated SEQ ID:18793, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27764] Another function of GAM180 is therefore inhibition of TRIAD3 (Accession NP_061884.2) . Accordingly, utilities of

GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIAD3.

[27765] Upstream binding protein 1 (lbp-1a) (UBP1, Accession NP_055332.2) is another GAM180 target gene, herein designated TARGET GENE. UBP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by UBP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UBP1 BINDING SITE, designated SEQ ID:3862, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27766] Another function of GAM180 is therefore inhibition of Upstream binding protein 1 (lbp-1a) (UBP1, Accession NP_055332.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBP1.

[27767] UNC5H2 (Accession NP_734465.1) is another GAM180 target gene, herein designated TARGET GENE. UNC5H2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by UNC5H2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of UNC5H2 BINDING SITE, designated SEQ ID:7676, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27768] Another function of GAM180 is therefore inhibition of UNC5H2 (Accession NP_734465.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UNC5H2.

[27769] VPS39 (Accession XP_031720.2) is another GAM180 target gene, herein designated TARGET GENE. VPS39 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by VPS39, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VPS39 BINDING SITE, designated SEQ ID:1316, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27770] Another function of GAM180 is therefore inhibition of VPS39 (Accession XP_031720.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VPS39.

[27771] WDFY2 (Accession NP_443182.1) is another GAM180 target gene, herein designated TARGET GENE. WDFY2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by WDFY2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WDFY2 BINDING SITE, designated SEQ ID:575, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27772] Another function of GAM180 is therefore inhibition of WDFY2 (Accession NP_443182.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WDFY2.

[27773] XT3 (Accession NP_071800.1) is another GAM180 target gene, herein designated TARGET GENE. XT3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by XT3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of XT3 BINDING SITE, designated SEQ ID:1554, to the nucleotide sequence of GAM180 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:214.

[27774] Another function of GAM180 is therefore inhibition of XT3 (Accession NP_071800.1), a gene which is a Kidney- specific orphan transporter. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XT3.

[27775] The function of XT3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM66.1.XT3 (Accession NP_064593.1) is another GAM180 target gene, herein designated TARGET GENE. XT3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by XT3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of XT3 BINDING SITE, designated SEQ ID:1554, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27776] Another function of GAM180 is therefore inhibition of XT3 (Accession NP_064593.1), a gene which is a Kidney- specific orphan transporter. Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with XT3.

[27777] The function of XT3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM66.1.Zonadhesin (ZAN, Accession NP_775078.1) is another GAM180 target gene, herein designated TARGET GENE. ZAN BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ZAN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZAN BINDING SITE, designated SEQ ID:17735, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27778] Another function of GAM180 is therefore inhibition of Zonadhesin (ZAN, Accession NP_775078.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZAN.

[27779] Zonadhesin (ZAN, Accession NP_775079.1) is another GAM180 target gene, herein designated TARGET GENE. ZAN BINDING SITE is a target binding site found in the 3`

untranslated region of multiple transcripts of mRNA encoded by ZAN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZAN BINDING SITE, designated SEQ ID:17735, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27780] Another function of GAM180 is therefore inhibition of Zonadhesin (ZAN, Accession NP_775079.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZAN.

[27781] Zonadhesin (ZAN, Accession NP_775080.1) is another GAM180 target gene, herein designated TARGET GENE. ZAN BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ZAN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZAN BINDING SITE, designated SEQ ID:17735, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27782] Another function of GAM180 is therefore inhibition of

Zonadhesin (ZAN, Accession NP_775080.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZAN.

[27783] Zonadhesin (ZAN, Accession NP_775081.1) is another GAM180 target gene, herein designated TARGET GENE. ZAN BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ZAN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZAN BINDING SITE, designated SEQ ID:17735, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27784] Another function of GAM180 is therefore inhibition of Zonadhesin (ZAN, Accession NP_775081.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZAN.

[27785] Zinc finger protein 235 (ZNF235, Accession NP_004225.2) is another GAM180 target gene, herein designated TARGET GENE. ZNF235 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by

ZNF235, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF235 BINDING SITE, designated SEQ ID:12391, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27786] Another function of GAM180 is therefore inhibition of Zinc finger protein 235 (ZNF235, Accession NP_004225.2) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF235.

[27787] Zinc finger protein 258 (ZNF258, Accession NP_009098.1) is another GAM180 target gene, herein designated TARGET GENE. ZNF258 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ZNF258, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF258 BINDING SITE, designated SEQ ID:8831, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27788] Another function of GAM180 is therefore inhibition of Zinc finger protein 258 (ZNF258, Accession NP_009098.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF258.

[27789] Zinc finger protein 258 (ZNF258, Accession NP_660353.1) is another GAM180 target gene, herein designated TARGET GENE. ZNF258 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ZNF258, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF258 BINDING SITE, designated SEQ ID:8831, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27790] Another function of GAM180 is therefore inhibition of Zinc finger protein 258 (ZNF258, Accession NP_660353.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF258.

[27791] Zinc finger protein 347 (ZNF347, Accession NP_115973.1) is another GAM180 target gene, herein designated TAR-

GET GENE. ZNF347 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF347, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF347 BINDING SITE, designated SEQ ID:7083, to the nucleotide sequence of GAM180 RNA, herein designated GAM RNA, also designated SEQ ID:214.

[27792] Another function of GAM180 is therefore inhibition of Zinc finger protein 347 (ZNF347, Accession NP_115973.1) . Accordingly, utilities of GAM180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF347.

[27793]

[27794] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 181 (GAM181), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27795] GAM181 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM181 was detected is described hereinabove

with reference to Figs. 8-15.

[27796] GAM181 gene, herein designated GAM GENE, and GAM181 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[27797] GAM181 gene encodes a GAM181 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM181 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM181 precursor RNA is designated SEQ ID:35, and is provided hereinbelow with reference to the sequence listing part.

[27798] GAM181 precursor RNA folds onto itself, forming GAM181 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27799] GAM181 precursor RNA folds onto itself, forming GAM181 folded precursor RNA, herein designated GAM FOLDED

PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[27800] Nucleotide sequence of GAM181 precursor RNA, designated SEQ-ID: 35, and a schematic representation of a predicted secondary folding of GAM181 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[27801] An enzyme complex designated DICER COMPLEX, `dices` the GAM181 folded precursor RNA into GAM181 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM181 RNA is designated SEQ ID:395, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby in-

corporated by reference.

[27802] GAM181 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM181 target RNA, herein designated GAM TARGET RNA. GAM181 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27803] GAM181 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM181 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM181 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM181 RNA may have a different number of target binding sites in untranslated regions of a GAM181 target RNA. It is further appreciated that while Fig. 8 depicts tar-

get binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27804] The complementary binding of GAM181 RNA, herein designated GAM RNA, to target binding sites on GAM181 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM181 target RNA into GAM181 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27805] It is appreciated that GAM181 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM181 target genes. The mRNA of each one of this plurality of GAM181 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM181 RNA, herein designated GAM RNA, and which when bound by GAM181 RNA causes inhibition of translation of respective one or more GAM181 target proteins.

[27806] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by

GAM181 gene, herein designated GAM GENE, on one or more GAM181 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27807] It is appreciated that specific functions and accordingly utilities of GAM181 correlate with, and may be deduced from, the identity of the target genes which GAM181 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27808]

[27809]

[27810] LOC200197 (Accession XM_114148.1) is a GAM181 target gene, herein designated TARGET GENE. LOC200197 BIND-

ING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC200197, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200197 BINDING SITE, designated SEQ ID:17783, to the nucleotide sequence of GAM181 RNA, herein designated GAM RNA, also designated SEQ ID:395.

[27811] A function of GAM181 is therefore inhibition of LOC200197 (Accession XM_114148.1) . Accordingly, utilities of GAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200197.

[27812] LOC90906 (Accession XM_034809.1) is another GAM181 target gene, herein designated TARGET GENE. LOC90906 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC90906, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90906 BINDING SITE, designated SEQ ID:2635, to the nucleotide sequence of GAM181 RNA, herein designated GAM RNA, also designated SEQ ID:395.

[27813] Another function of GAM181 is therefore inhibition of LOC90906 (Accession XM_034809.1) . Accordingly, utilities of GAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90906.

[27814] LOC91137 (Accession NM_138773.1) is another GAM181 target gene, herein designated TARGET GENE. LOC91137 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91137, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91137 BINDING SITE, designated SEQ ID:17149, to the nucleotide sequence of GAM181 RNA, herein designated GAM RNA, also designated SEQ ID:395.

[27815] Another function of GAM181 is therefore inhibition of LOC91137 (Accession NM_138773.1) . Accordingly, utilities of GAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91137.

[27816] NET-5 (Accession NM_006675.2) is another GAM181 target gene, herein designated TARGET GENE. NET-5 BINDING SITE is a target binding site found in the 3` untrans-

lated region of mRNA encoded by NET-5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NET-5 BINDING SITE, designated SEQ ID:464, to the nucleotide sequence of GAM181 RNA, herein designated GAM RNA, also designated SEQ ID:395.

[27817] Another function of GAM181 is therefore inhibition of NET-5 (Accession NM_006675.2) . Accordingly, utilities of GAM181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NET-5.

[27818] SIMRP7 (Accession) is another GAM181 target gene, herein designated TARGET GENE. SIMRP7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SIMRP7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIMRP7 BINDING SITE, designated SEQ ID:9314, to the nucleotide sequence of GAM181 RNA, herein designated GAM RNA, also designated SEQ ID:395.

[27819] Another function of GAM181 is therefore inhibition of SIMRP7 (Accession) . Accordingly, utilities of GAM181 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with SIMRP7.

[27820]

[27821] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 182 (GAM182), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27822] GAM182 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM182 was detected is described hereinabove with reference to Figs. 8-15.

[27823] GAM182 gene, herein designated GAM GENE, and GAM182 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[27824] GAM182 gene encodes a GAM182 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM182 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM182 precursor RNA is designated SEQ ID:144, and is provided hereinbelow with reference to the sequence list-

ing part. Nucleotide sequence SEQ ID:144 is located at position 1427020 relative to chromosome 16.

[27825] GAM182 precursor RNA folds onto itself, forming GAM182 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27826] GAM182 precursor RNA folds onto itself, forming GAM182 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[27827] Nucleotide sequence of GAM182 precursor RNA, designated SEQ-ID: 144, and a schematic representation of a predicted secondary folding of GAM182 folded precursor

RNA are further described with reference to Table 2, hereby incorporated by reference.

[27828] An enzyme complex designated DICER COMPLEX, `dices` the GAM182 folded precursor RNA into GAM182 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM182 RNA is designated SEQ ID:307, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[27829] GAM182 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM182 target RNA, herein designated GAM TARGET RNA. GAM182 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27830] GAM182 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in

untranslated regions of GAM182 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM182 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM182 RNA may have a different number of target binding sites in untranslated regions of a GAM182 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27831] The complementary binding of GAM182 RNA, herein designated GAM RNA, to target binding sites on GAM182 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM182 target RNA into GAM182 target protein, herein designated GAM TARGET PROTEIN.

GAM target protein is therefore outlined by a broken line.

[27832] It is appreciated that GAM182 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM182 target genes. The mRNA of each one of this plurality of GAM182 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM182 RNA, herein designated GAM RNA, and which when bound by GAM182 RNA causes inhibition of translation of respective one or more GAM182 target proteins.

[27833] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM182 gene, herein designated GAM GENE, on one or more GAM182 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific com-

plementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27834] It is appreciated that specific functions and accordingly utilities of GAM182 correlate with, and may be deduced from, the identity of the target genes which GAM182 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27835]

[27836]

[27837] AF020591 (Accession NM_014480.1) is a GAM182 target gene, herein designated TARGET GENE. AF020591 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AF020591, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AF020591 BINDING SITE, designated SEQ ID:19423, to the nucleotide sequence of GAM182 RNA, herein designated GAM RNA, also designated SEQ ID:307.

[27838] A function of GAM182 is therefore inhibition of AF020591 (Accession NM_014480.1) . Accordingly, utilities of

GAM182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AF020591.

[27839] CASKIN1 (Accession NM_020764.1) is another GAM182 target gene, herein designated TARGET GENE. CASKIN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CASKIN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CASKIN1 BINDING SITE, designated SEQ ID:7419, to the nucleotide sequence of GAM182 RNA, herein designated GAM RNA, also designated SEQ ID:307.

[27840] Another function of GAM182 is therefore inhibition of CASKIN1 (Accession NM_020764.1) . Accordingly, utilities of GAM182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASKIN1.

[27841] KIAA0565 (Accession XM_039912.4) is another GAM182 target gene, herein designated TARGET GENE. KIAA0565 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0565, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0565 BINDING SITE, designated SEQ ID:19085, to the nucleotide sequence of GAM182 RNA, herein designated GAM RNA, also designated SEQ ID:307.

[27842] Another function of GAM182 is therefore inhibition of KIAA0565 (Accession XM_039912.4) . Accordingly, utilities of GAM182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0565.

[27843] Lim domain binding 3 (LDB3, Accession XM_084376.6) is another GAM182 target gene, herein designated TARGET GENE. LDB3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LDB3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LDB3 BINDING SITE, designated SEQ ID:3284, to the nucleotide sequence of GAM182 RNA, herein designated GAM RNA, also designated SEQ ID:307.

[27844] Another function of GAM182 is therefore inhibition of Lim domain binding 3 (LDB3, Accession XM_084376.6), a gene which could play a role during mating. Accordingly, utili-

ties of GAM182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LDB3.

[27845] The function of LDB3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.LOC124470 (Accession) is another GAM182 target gene, herein designated TARGET GENE. LOC124470 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC124470, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC124470 BINDING SITE, designated SEQ ID:12795, to the nucleotide sequence of GAM182 RNA, herein designated GAM RNA, also designated SEQ ID:307.

[27846] Another function of GAM182 is therefore inhibition of LOC124470 (Accession) . Accordingly, utilities of GAM182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124470.

[27847] LOC256207 (Accession) is another GAM182 target gene, herein designated TARGET GENE. LOC256207 BINDING

SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC256207, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC256207 BINDING SITE, designated SEQ ID:2860, to the nucleotide sequence of GAM182 RNA, herein designated GAM RNA, also designated SEQ ID:307.

[27848] Another function of GAM182 is therefore inhibition of LOC256207 (Accession) . Accordingly, utilities of GAM182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256207.

[27849] SCYA19 (Accession) is another GAM182 target gene, herein designated TARGET GENE. SCYA19 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SCYA19, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SCYA19 BINDING SITE, designated SEQ ID:10974, to the nucleotide sequence of GAM182 RNA, herein designated GAM RNA, also designated SEQ ID:307.

[27850] Another function of GAM182 is therefore inhibition of SCYA19 (Accession) . Accordingly, utilities of GAM182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCYA19.

[27851] Transforming growth factor, alpha (TGFA, Accession NM_003236.1) is another GAM182 target gene, herein designated TARGET GENE. TGFA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TGFA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TGFA BINDING SITE, designated SEQ ID:9112, to the nucleotide sequence of GAM182 RNA, herein designated GAM RNA, also designated SEQ ID:307.

[27852] Another function of GAM182 is therefore inhibition of Transforming growth factor, alpha (TGFA, Accession NM_003236.1), a gene which is able to bind to the egf receptor and to act synergistically with tgf beta to promote anchorage- independent cell proliferation in soft agar. Accordingly, utilities of GAM182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFA.

[27853] The function of TGFA and its association with various dis-

eases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM94.1.

[27854] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 183 (GAM183), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27855] GAM183 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM183 was detected is described hereinabove with reference to Figs. 8-15.

[27856] GAM183 gene, herein designated GAM GENE, and GAM183 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[27857] GAM183 gene encodes a GAM183 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM183 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM183 precursor RNA is designated SEQ ID:7, and is provided hereinbelow with reference to the sequence list-

ing part.

[27858] GAM183 precursor RNA folds onto itself, forming GAM183 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27859] GAM183 precursor RNA folds onto itself, forming GAM183 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[27860] Nucleotide sequence of GAM183 precursor RNA, designated SEQ-ID: 7, and a schematic representation of a predicted secondary folding of GAM183 folded precursor RNA are further described with reference to Table 2, hereby in-

corporated by reference.

[27861] An enzyme complex designated DICER COMPLEX, `dices` the GAM183 folded precursor RNA into GAM183 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM183 RNA is designated SEQ ID:240, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[27862] GAM183 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM183 target RNA, herein designated GAM TARGET RNA. GAM183 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27863] GAM183 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM183 target RNA, herein des-

ignated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM183 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM183 RNA may have a different number of target binding sites in untranslated regions of a GAM183 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27864] The complementary binding of GAM183 RNA, herein designated GAM RNA, to target binding sites on GAM183 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM183 target RNA into GAM183 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27865] It is appreciated that GAM183 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM183 target genes. The mRNA of each one of this plurality of GAM183 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM183 RNA, herein designated GAM RNA, and which when bound by GAM183 RNA causes inhibition of translation of respective one or more GAM183 target proteins.

[27866] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM183 gene, herein designated GAM GENE, on one or more GAM183 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have

not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27867] It is appreciated that specific functions and accordingly utilities of GAM183 correlate with, and may be deduced from, the identity of the target genes which GAM183 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27868]

[27869]

[27870] DKFZP434J1813 (Accession) is a GAM183 target gene, herein designated TARGET GENE. DKFZP434J1813 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP434J1813, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434J1813 BINDING SITE, designated SEQ ID:16705, to the nucleotide sequence of GAM183 RNA, herein designated GAM RNA, also designated SEQ ID:240.

[27871] A function of GAM183 is therefore inhibition of DKFZP434J1813 (Accession) . Accordingly, utilities of GAM183 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with DK-FZP434J1813.

[27872] KIAA1025 (Accession XM_034056.6) is another GAM183 target gene, herein designated TARGET GENE. KIAA1025 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1025, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1025 BINDING SITE, designated SEQ ID:5814, to the nucleotide sequence of GAM183 RNA, herein designated GAM RNA, also designated SEQ ID:240.

[27873] Another function of GAM183 is therefore inhibition of KIAA1025 (Accession XM_034056.6) . Accordingly, utilities of GAM183 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1025.

[27874] MGC22805 (Accession NM_144590.1) is another GAM183 target gene, herein designated TARGET GENE. MGC22805 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC22805, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of MGC22805 BINDING SITE, designated SEQ ID:15928, to the nucleotide sequence of GAM183 RNA, herein designated GAM RNA, also designated SEQ ID:240.

[27875] Another function of GAM183 is therefore inhibition of MGC22805 (Accession NM_144590.1) . Accordingly, utilities of GAM183 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC22805.

[27876] Prostaglandin-endoperoxide synthase 2 (prostaglandin g/h synthase and cyclooxygenase) (PTGS2, Accession NM_000963.1) is another GAM183 target gene, herein designated TARGET GENE. PTGS2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PTGS2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTGS2 BINDING SITE, designated SEQ ID:14372, to the nucleotide sequence of GAM183 RNA, herein designated GAM RNA, also designated SEQ ID:240.

[27877] Another function of GAM183 is therefore inhibition of Prostaglandin-endoperoxide synthase 2 (prostaglandin g/

h synthase and cyclooxygenase) (PTGS2, Accession NM_000963.1), a gene which may have a role as a major mediator of inflammation and/or a role for prostanoid signaling in activity- dependent plasticity. and therefore may be associated with Inflammatory diseases such as rheumatoid arthritis. Accordingly, utilities of GAM183 include diagnosis, prevention and treatment of Inflammatory diseases such as rheumatoid arthritis., and of other diseases and clinical conditions associated with PTGS2.

[27878] The function of PTGS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM100.1.

[27879] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 184 (GAM184), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27880] GAM184 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM184 was detected is described hereinabove with reference to Figs. 8-15.

[27881] GAM184 gene, herein designated GAM GENE, and GAM184 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[27882] GAM184 gene encodes a GAM184 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM184 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM184 precursor RNA is designated SEQ ID:50, and is provided hereinbelow with reference to the sequence listing part.

[27883] GAM184 precursor RNA folds onto itself, forming GAM184 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27884] GAM184 precursor RNA folds onto itself, forming GAM184 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[27885] Nucleotide sequence of GAM184 precursor RNA, designated SEQ-ID: 50, and a schematic representation of a predicted secondary folding of GAM184 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[27886] An enzyme complex designated DICER COMPLEX, `dices` the GAM184 folded precursor RNA into GAM184 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM184 RNA is designated SEQ ID:284, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[27887] GAM184 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM184 target RNA, herein designated GAM TARGET RNA. GAM184 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27888] GAM184 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM184 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM184 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM184 RNA may have a different number of target binding sites in untranslated regions of a GAM184 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an

example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27889] The complementary binding of GAM184 RNA, herein designated GAM RNA, to target binding sites on GAM184 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM184 target RNA into GAM184 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27890] It is appreciated that GAM184 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM184 target genes. The mRNA of each one of this plurality of GAM184 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM184 RNA, herein designated GAM RNA, and which when bound by GAM184 RNA causes inhibition of translation of respective one or more GAM184 target proteins.

[27891] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM184 gene, herein designated GAM GENE, on one or

more GAM184 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27892] It is appreciated that specific functions and accordingly utilities of GAM184 correlate with, and may be deduced from, the identity of the target genes which GAM184 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27893]

[27894]

[27895] Transforming growth factor, beta receptor ii (70/80kda) (TGFBR2, Accession NM_003242.3) is a GAM184 target gene, herein designated TARGET GENE. TGFBR2 BINDING

SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TGFBR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TGFBR2 BINDING SITE, designated SEQ ID:9885, to the nucleotide sequence of GAM184 RNA, herein designated GAM RNA, also designated SEQ ID:284.

[27896] A function of GAM184 is therefore inhibition of Transforming growth factor, beta receptor ii (70/80kda) (TGFBR2, Accession NM_003242.3) . Accordingly, utilities of GAM184 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFBR2.

[27897]

[27898] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 185 (GAM185), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27899] GAM185 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method

by which GAM185 was detected is described hereinabove with reference to Figs. 8-15.

[27900] GAM185 gene, herein designated GAM GENE, and GAM185 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[27901] GAM185 gene encodes a GAM185 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM185 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM185 precursor RNA is designated SEQ ID:78, and is provided hereinbelow with reference to the sequence listing part.

[27902] GAM185 precursor RNA folds onto itself, forming GAM185 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27903] GAM185 precursor RNA folds onto itself, forming GAM185

folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[27904] Nucleotide sequence of GAM185 precursor RNA, designated SEQ-ID: 78, and a schematic representation of a predicted secondary folding of GAM185 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[27905] An enzyme complex designated DICER COMPLEX, `dices` the GAM185 folded precursor RNA into GAM185 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM185 RNA is designated SEQ ID:372, and is provided hereinbelow with refer-

ences to the sequence listing part and Table 3, hereby incorporated by reference.

[27906] GAM185 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM185 target RNA, herein designated GAM TARGET RNA. GAM185 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27907] GAM185 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM185 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM185 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM185 RNA may have a different number of target binding sites in untranslated regions of a GAM185 target

RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27908] The complementary binding of GAM185 RNA, herein designated GAM RNA, to target binding sites on GAM185 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM185 target RNA into GAM185 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27909] It is appreciated that GAM185 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM185 target genes. The mRNA of each one of this plurality of GAM185 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM185 RNA, herein designated GAM RNA, and which when bound by GAM185 RNA causes inhibition of translation of respective one or more GAM185 target proteins.

[27910] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with

specific reference to translational inhibition exerted by GAM185 gene, herein designated GAM GENE, on one or more GAM185 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27911] It is appreciated that specific functions and accordingly utilities of GAM185 correlate with, and may be deduced from, the identity of the target genes which GAM185 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27912]

[27913]

[27914] Grb2-associated binding protein 2 (GAB2, Accession

NM_080491.1) is a GAM185 target gene, herein designated TARGET GENE. GAB2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GAB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GAB2 BINDING SITE, designated SEQ ID:18059, to the nucleotide sequence of GAM185 RNA, herein designated GAM RNA, also designated SEQ ID:372.

[27915] A function of GAM185 is therefore inhibition of Grb2-associated binding protein 2 (GAB2, Accession NM_080491.1), a gene which act as adapters for transmitting various signals. Accordingly, utilities of GAM185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAB2.

[27916] The function of GAB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Growth arrest and dna-damage-inducible, beta (GADD45B, Accession NM_015675.1) is another GAM185 target gene, herein designated TARGET GENE. GADD45B BINDING SITE is a target binding site found in

the 3` untranslated region of mRNA encoded by GADD45B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GADD45B BINDING SITE, designated SEQ ID:9982, to the nucleotide sequence of GAM185 RNA, herein designated GAM RNA, also designated SEQ ID:372.

[27917] Another function of GAM185 is therefore inhibition of Growth arrest and dna-damage-inducible, beta (GADD45B, Accession NM_015675.1), a gene which activates MTK1 kinase activity and maybe involved in stress response. Accordingly, utilities of GAM185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GADD45B.

[27918] The function of GADD45B has been established by previous studies. The stress- responsive p38 (see OMIM Ref. No. MAPK14; 600289) and JNK (see OMIM Ref. No. MAPK8; 601158) mitogen- activated protein kinase (MAPK) pathways regulate cell cycle and apoptosis. A human MAP3K, MTK1 (MAP3K4; 602425), mediates activation of both p38 and JNK in response to environmental stresses. By screening a placenta cDNA library using a yeast 2- hybrid method, Takekawa and Saito (1998) isolated cDNAs en-

coding 3 related proteins, GADD45- alpha (GADD45A; 126335), GADD45- beta (GADD45B), and GADD45- gamma (GADD45G; 604949), that bound to an N- terminal domain of MTK1. The deduced GADD45B protein contains 160 amino acids. GADD45A, GADD45B, and GADD45G share 55 to 58% amino acid identity. These proteins activated MTK1 kinase activity, both in vivo and in vitro. All 3 GADD45- like genes were induced by environmental stresses, including methyl methanesulfonate, UV, and gamma irradiation. Expression of the GADD45- like genes induced p38/JNK activation and apoptosis, which could be partially suppressed by coexpression of a dominant inhibitory MTK1 mutant protein. Northern blot analysis detected strong expression of a 1.4- kb GADD45B transcript in heart and liver, with moderate expression in placenta, lung, skeletal muscle, kidney, and pancreas, and little or no expression in brain. Takekawa and Saito (1998) proposed that the GADD45- like proteins mediate activation of the p38/JNK pathway, via MTK1, in response to environmental stresses.

[27919]

[27920] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[27921] De Smaele, E.; Zazzeroni, F.; Papa, S.; Nguyen, D. U.; Jin, R.; Jones, J.; Cong, R.; Franzoso, G. : Induction of gadd45-beta by NF- kappa- B downregulates pro- apoptotic JNK signaling. Nature 414: 308- 313, 2001. ; and

[27922] Takekawa, M.; Saito, H. : A family of stress- inducible GADD45- like proteins mediate activation of the stress-responsive MTK1/MEKK4 MAPKKK. Cell 95: 521- 530, 1998.

[27923] Further studies establishing the function and utilities of GADD45B are found in John Hopkins OMIM database record ID 604948, and in cited publications listed in Table 5, which are hereby incorporated by reference.

[27924] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 186 (GAM186), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27925] GAM186 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM186 was detected is described hereinabove with reference to Figs. 8-15.

[27926] GAM186 gene, herein designated GAM GENE, and GAM186 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[27927] GAM186 gene encodes a GAM186 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM186 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM186 precursor RNA is designated SEQ ID:57, and is provided hereinbelow with reference to the sequence listing part.

[27928] GAM186 precursor RNA folds onto itself, forming GAM186 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27929] GAM186 precursor RNA folds onto itself, forming GAM186 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[27930] Nucleotide sequence of GAM186 precursor RNA, designated SEQ-ID: 57, and a schematic representation of a predicted secondary folding of GAM186 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[27931] An enzyme complex designated DICER COMPLEX, `dices` the GAM186 folded precursor RNA into GAM186 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM186 RNA is designated SEQ ID:353, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[27932] GAM186 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM186 target RNA, herein designated GAM TARGET RNA. GAM186 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27933] GAM186 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM186 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM186 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM186 RNA may have a different number of target binding sites in untranslated regions of a GAM186 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an

example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27934] The complementary binding of GAM186 RNA, herein designated GAM RNA, to target binding sites on GAM186 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM186 target RNA into GAM186 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27935] It is appreciated that GAM186 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM186 target genes. The mRNA of each one of this plurality of GAM186 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM186 RNA, herein designated GAM RNA, and which when bound by GAM186 RNA causes inhibition of translation of respective one or more GAM186 target proteins.

[27936] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM186 gene, herein designated GAM GENE, on one or

more GAM186 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27937] It is appreciated that specific functions and accordingly utilities of GAM186 correlate with, and may be deduced from, the identity of the target genes which GAM186 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27938]

[27939]

[27940] LOC147671 (Accession XM_085844.2) is a GAM186 target gene, herein designated TARGET GENE. LOC147671 BINDING SITE is a target binding site found in the 3` untrans-

lated region of mRNA encoded by LOC147671, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147671 BINDING SITE, designated SEQ ID:2416, to the nucleotide sequence of GAM186 RNA, herein designated GAM RNA, also designated SEQ ID:353.

[27941] A function of GAM186 is therefore inhibition of LOC147671 (Accession XM_085844.2) . Accordingly, utilities of GAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147671.

[27942] MGC4093 (Accession NM_030578.1) is another GAM186 target gene, herein designated TARGET GENE. MGC4093 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC4093, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC4093 BINDING SITE, designated SEQ ID:15121, to the nucleotide sequence of GAM186 RNA, herein designated GAM RNA, also designated SEQ ID:353.

[27943] Another function of GAM186 is therefore inhibition of

MGC4093 (Accession NM_030578.1) . Accordingly, utilities of GAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4093.

[27944] SMAC (Accession NM_138929.1) is another GAM186 target gene, herein designated TARGET GENE. SMAC BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by SMAC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SMAC BINDING SITE, designated SEQ ID:450, to the nucleotide sequence of GAM186 RNA, herein designated GAM RNA, also designated SEQ ID:353.

[27945] Another function of GAM186 is therefore inhibition of SMAC (Accession NM_138929.1), a gene which promotes apoptosis via caspase activation. Accordingly, utilities of GAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMAC.

[27946] The function of SMAC and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM136.1.Zuotin related factor 1 (ZRF1, Accession

XM_168590.3) is another GAM186 target gene, herein designated TARGET GENE. ZRF1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ZRF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZRF1 BINDING SITE, designated SEQ ID:12343, to the nucleotide sequence of GAM186 RNA, herein designated GAM RNA, also designated SEQ ID:353.

[27947] Another function of GAM186 is therefore inhibition of Zuotin related factor 1 (ZRF1, Accession XM_168590.3) . Accordingly, utilities of GAM186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZRF1.

[27948]

[27949] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 187 (GAM187), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27950] GAM187 is a novel bioinformatically detected regulatory,

non protein coding, micro RNA (miRNA) gene. The method by which GAM187 was detected is described hereinabove with reference to Figs. 8-15.

[27951] GAM187 gene, herein designated GAM GENE, and GAM187 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[27952] GAM187 gene encodes a GAM187 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM187 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM187 precursor RNA is designated SEQ ID:83, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:83 is located at position 48266940 relative to chromosome 17.

[27953] GAM187 precursor RNA folds onto itself, forming GAM187 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide

sequence of the second half thereof.

[27954] GAM187 precursor RNA folds onto itself, forming GAM187 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[27955] Nucleotide sequence of GAM187 precursor RNA, designated SEQ-ID: 83, and a schematic representation of a predicted secondary folding of GAM187 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[27956] An enzyme complex designated DICER COMPLEX, `dices` the GAM187 folded precursor RNA into GAM187 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy

Group: C) nucleotide sequence of GAM187 RNA is designated SEQ ID:294, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[27957] GAM187 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM187 target RNA, herein designated GAM TARGET RNA. GAM187 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27958] GAM187 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM187 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM187 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limit-

ing GAM187 RNA may have a different number of target binding sites in untranslated regions of a GAM187 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27959] The complementary binding of GAM187 RNA, herein designated GAM RNA, to target binding sites on GAM187 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM187 target RNA into GAM187 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27960] It is appreciated that GAM187 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM187 target genes. The mRNA of each one of this plurality of GAM187 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM187 RNA, herein designated GAM RNA, and which when bound by GAM187 RNA causes inhibition of translation of respective one or more GAM187 target proteins.

[27961] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM187 gene, herein designated GAM GENE, on one or more GAM187 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27962] It is appreciated that specific functions and accordingly utilities of GAM187 correlate with, and may be deduced from, the identity of the target genes which GAM187 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27963]

[27964]

[27965] Eukaryotic translation initiation factor 4e binding protein 2 (EIF4EBP2, Accession NM_004096.2) is a GAM187 target gene, herein designated TARGET GENE. EIF4EBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EIF4EBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EIF4EBP2 BINDING SITE, designated SEQ ID:13732, to the nucleotide sequence of GAM187 RNA, herein designated GAM RNA, also designated SEQ ID:294.

[27966] A function of GAM187 is therefore inhibition of Eukaryotic translation initiation factor 4e binding protein 2 (EIF4EBP2, Accession NM_004096.2), a gene which binds EIF4E and negatively regulates initiation of translation. and therefore may be associated with Cancers. Accordingly, utilities of GAM187 include diagnosis, prevention and treatment of Cancers, and of other diseases and clinical conditions associated with EIF4EBP2.

[27967] The function of EIF4EBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM144.1.FLJ20487 (Accession NM_017841.1) is an-

other GAM187 target gene, herein designated TARGET GENE. FLJ20487 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20487, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20487 BINDING SITE, designated SEQ ID:6750, to the nucleotide sequence of GAM187 RNA, herein designated GAM RNA, also designated SEQ ID:294.

[27968] Another function of GAM187 is therefore inhibition of FLJ20487 (Accession NM_017841.1) . Accordingly, utilities of GAM187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20487.

[27969] LOC93259 (Accession XM_050105.2) is another GAM187 target gene, herein designated TARGET GENE. LOC93259 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC93259, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC93259 BINDING SITE, designated SEQ ID:7403, to the nucleotide sequence of GAM187 RNA, herein designated

GAM RNA, also designated SEQ ID:294.

[27970] Another function of GAM187 is therefore inhibition of LOC93259 (Accession XM_050105.2) . Accordingly, utilities of GAM187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93259.

[27971] Prostaglandin f2 receptor negative regulator (PTGFRN, Accession XM_040709.3) is another GAM187 target gene, herein designated TARGET GENE. PTGFRN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PTGFRN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTGFRN BINDING SITE, designated SEQ ID:7229, to the nucleotide sequence of GAM187 RNA, herein designated GAM RNA, also designated SEQ ID:294.

[27972] Another function of GAM187 is therefore inhibition of Prostaglandin f2 receptor negative regulator (PTGFRN, Accession XM_040709.3), a gene which inhibits the binding of prostaglandin f2- alpha (pgf2- alpha) to its specific fp receptor. Accordingly, utilities of GAM187 include diagnosis, prevention and treatment of diseases and clinical con-

ditions associated with PTGFRN.

[27973] The function of PTGFRN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM94.1.

[27974] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 188 (GAM188), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27975] GAM188 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM188 was detected is described hereinabove with reference to Figs. 8-15.

[27976] GAM188 gene, herein designated GAM GENE, and GAM188 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[27977] GAM188 gene encodes a GAM188 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM188 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of

GAM188 precursor RNA is designated SEQ ID:12, and is provided hereinbelow with reference to the sequence listing part.

[27978] GAM188 precursor RNA folds onto itself, forming GAM188 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27979] GAM188 precursor RNA folds onto itself, forming GAM188 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[27980] Nucleotide sequence of GAM188 precursor RNA, designated SEQ-ID: 12, and a schematic representation of a

predicted secondary folding of GAM188 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[27981] An enzyme complex designated DICER COMPLEX, `dices` the GAM188 folded precursor RNA into GAM188 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM188 RNA is designated SEQ ID:286, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[27982] GAM188 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM188 target RNA, herein designated GAM TARGET RNA. GAM188 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27983] GAM188 RNA, herein designated GAM RNA, binds com-

plementarily to one or more target binding sites located in untranslated regions of GAM188 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM188 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM188 RNA may have a different number of target binding sites in untranslated regions of a GAM188 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27984] The complementary binding of GAM188 RNA, herein designated GAM RNA, to target binding sites on GAM188 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM188 target RNA into GAM188 tar-

get protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[27985] It is appreciated that GAM188 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM188 target genes. The mRNA of each one of this plurality of GAM188 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM188 RNA, herein designated GAM RNA, and which when bound by GAM188 RNA causes inhibition of translation of respective one or more GAM188 target proteins.

[27986] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM188 gene, herein designated GAM GENE, on one or more GAM188 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other

genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[27987] It is appreciated that specific functions and accordingly utilities of GAM188 correlate with, and may be deduced from, the identity of the target genes which GAM188 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27988]

[27989]

[27990] DKFZp434M0331 (Accession NM_017600.1) is a GAM188 target gene, herein designated TARGET GENE. DKFZp434M0331 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZp434M0331, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434M0331 BINDING SITE, designated SEQ ID:4117, to the nucleotide sequence of GAM188 RNA, herein designated GAM RNA, also designated SEQ ID:286.

[27991] A function of GAM188 is therefore inhibition of DKFZp434M0331 (Accession NM_017600.1) . Accordingly, utilities of GAM188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434M0331.

[27992] Grb2-associated binding protein 3 (GAB3, Accession NM_080612.1) is another GAM188 target gene, herein designated TARGET GENE. GAB3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GAB3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GAB3 BINDING SITE, designated SEQ ID:5720, to the nucleotide sequence of GAM188 RNA, herein designated GAM RNA, also designated SEQ ID:286.

[27993] Another function of GAM188 is therefore inhibition of Grb2-associated binding protein 3 (GAB3, Accession NM_080612.1) . Accordingly, utilities of GAM188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAB3.

[27994] LOC142955 (Accession XM_084389.4) is another GAM188 target gene, herein designated TARGET GENE. LOC142955 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC142955, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC142955 BINDING SITE, designated SEQ ID:12714, to the nucleotide sequence of GAM188 RNA, herein designated GAM RNA, also designated SEQ ID:286.

[27995] Another function of GAM188 is therefore inhibition of LOC142955 (Accession XM_084389.4) . Accordingly, utilities of GAM188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC142955.

[27996]

[27997] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 189 (GAM189), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[27998] GAM189 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM189 was detected is described hereinabove with reference to Figs. 8-15.

[27999] GAM189 gene, herein designated GAM GENE, and GAM189 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[28000] GAM189 gene encodes a GAM189 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM189 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM189 precursor RNA is designated SEQ ID:9, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:9 is located at position 95450006 relative to chromosome 4.

[28001] GAM189 precursor RNA folds onto itself, forming GAM189 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28002] GAM189 precursor RNA folds onto itself, forming GAM189 folded precursor RNA, herein designated GAM FOLDED

PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[28003] Nucleotide sequence of GAM189 precursor RNA, designated SEQ-ID: 9, and a schematic representation of a predicted secondary folding of GAM189 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[28004] An enzyme complex designated DICER COMPLEX, `dices` the GAM189 folded precursor RNA into GAM189 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: B) nucleotide sequence of GAM189 RNA is designated SEQ ID:246, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby in-

corporated by reference.

[28005] GAM189 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM189 target RNA, herein designated GAM TARGET RNA. GAM189 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[28006] GAM189 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM189 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM189 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM189 RNA may have a different number of target binding sites in untranslated regions of a GAM189 target RNA. It is further appreciated that while Fig. 8 depicts tar-

get binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[28007] The complementary binding of GAM189 RNA, herein designated GAM RNA, to target binding sites on GAM189 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM189 target RNA into GAM189 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[28008] It is appreciated that GAM189 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM189 target genes. The mRNA of each one of this plurality of GAM189 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM189 RNA, herein designated GAM RNA, and which when bound by GAM189 RNA causes inhibition of translation of respective one or more GAM189 target proteins.

[28009] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by

GAM189 gene, herein designated GAM GENE, on one or more GAM189 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[28010] It is appreciated that specific functions and accordingly utilities of GAM189 correlate with, and may be deduced from, the identity of the target genes which GAM189 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28011]

[28012]

[28013] 15E1.2 (Accession XP_290596.1) is a GAM189 target gene, herein designated TARGET GENE. 15E1.2 BINDING

SITE is a target binding site found in the 3` untranslated region of mRNA encoded by 15E1.2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of 15E1.2 BINDING SITE, designated SEQ ID:12868, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28014] A function of GAM189 is therefore inhibition of 15E1.2 (Accession XP_290596.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with 15E1.2.

[28015] Alpha-1-b glycoprotein (A1BG, Accession NP_570602.2) is another GAM189 target gene, herein designated TARGET GENE. A1BG BINDING SITE1 and A1BG BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by A1BG, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of A1BG BINDING SITE1 and A1BG BINDING SITE2, designated SEQ ID:18868 and SEQ ID:2534 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:246.

[28016] Another function of GAM189 is therefore inhibition of Alpha-1-b glycoprotein (A1BG, Accession NP_570602.2), a gene which a plasma protein of unknown function. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with A1BG.

[28017] The function of A1BG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM130.1.Aminoadipate-semialdehyde synthase (AASS, Accession NP_005754.2) is another GAM189 target gene, herein designated TARGET GENE. AASS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AASS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AASS BINDING SITE, designated SEQ ID:6339, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28018] Another function of GAM189 is therefore inhibition of Aminoadipate-semialdehyde synthase (AASS, Accession

NP_005754.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AASS.

[28019] ABCA13 (Accession NP_689914.2) is another GAM189 target gene, herein designated TARGET GENE. ABCA13 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ABCA13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABCA13 BINDING SITE, designated SEQ ID:7385, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28020] Another function of GAM189 is therefore inhibition of ABCA13 (Accession NP_689914.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCA13.

[28021] Atp-binding cassette, sub-family c (cftr/mrp), member 11 (ABCC11, Accession NP_149163.2) is another GAM189 target gene, herein designated TARGET GENE. ABCC11 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded

by ABCC11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABCC11 BINDING SITE, designated SEQ ID:7022, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28022] Another function of GAM189 is therefore inhibition of Atp-binding cassette, sub-family c (cftr/mrp), member 11 (ABCC11, Accession NP_149163.2), a gene which acts as a multispecific organic anion pump which can transport nucleotide analogs (by similarity). Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCC11.

[28023] The function of ABCC11 has been established by previous studies. Tammur et al. (2001) identified ABCC11 and ABCC12 (OMIM Ref. No. 607041) by database analysis using ABC transporter sequences as queries. The deduced 1,382- amino acid ABCC11 protein contains 2 ATP- binding domains and 2 transmembrane regions. It shares 40%, 33%, 32%, and 32% amino acid sequence identity with ABCC5 (OMIM Ref. No. 605251), ABCC4 (OMIM Ref. No. 605250), ABCC2 (OMIM Ref. No. 601107), and ABCC3 (OMIM Ref. No. 604323), respectively. PCR of a 16- tissue

panel revealed expression in all tissues examined except kidney, spleen, and colon. The author determined that a second PCR product identified in lung was a splice variant lacking exon 9. Tammur et al. (2001) mapped the ABCC11 gene to chromosome 16q12.1 by radiation hybrid analysis. They noted that the ABCC11 and ABCC12 genes are contained within a BAC clone mapping to 16q12.1. Tammur et al. (2001) stated that the chromosomal localization, potential function, and expression profiles of the ABCC11 and ABCC12 genes make them promising candidates for paroxysmal kinesigenic choreoathetosis (PKC; 128200) and infantile convulsions with paroxysmal choreoathetosis (ICCA; 602066).

[28024]

[28025] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28026] Tammur, J.; Prades, C.; Arnould, I.; Rzhetsky, A.; Hutchinson, A.; Adachi, M.; Schuetz, J. D.; Swoboda, K. J.; Ptacek, L. J.; Rosier, M.; Dean, M.; Allikmets, R. : Two new genes from the human ATP- binding cassette transporter superfamily, ABCC11 and ABCC12, tandemly duplicated on chromosome 16q12. Gene 273: 89- 96, 2001. ; and

[28027] Bera, T. K.; Lee, S.; Salvatore, G.; Lee, B.; Pastan, I. : MRP8, a new member of ABC transporter superfamily, identified by EST database mining and gene prediction program, is highly ex.

[28028] Further studies establishing the function and utilities of ABCC11 are found in John Hopkins OMIM database record ID 607040, and in cited publications listed in Table 5, which are hereby incorporated by reference.Atp-binding cassette, sub-family d (ald), member 3 (ABCD3, Accession NP_002849.1) is another GAM189 target gene, herein designated TARGET GENE. ABCD3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ABCD3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABCD3 BINDING SITE, designated SEQ ID:14444, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28029] Another function of GAM189 is therefore inhibition of Atp-binding cassette, sub-family d (ald), member 3 (ABCD3, Accession NP_002849.1), a gene which a proba-ble transporter. and therefore is associated with Zellweger

syndrome- 2 (zws- 2). Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Zellweger syndrome- 2 (zws- 2)., and of other diseases and clinical conditions associated with ABCD3.

[28030] The function of ABCD3 has been established by previous studies. Peroxisomes are single, membrane- bound, spheroid organelles present in virtually all eukaryotic cells. The polypeptide composition of the peroxisomal membrane is distinct from that of other organelles and comprises 2 quantitatively major (22K and 70K) and several minor peroxisomal membrane proteins. The peroxisome matrix contains more than 40 enzymes which are involved in a variety of metabolic processes including peroxide- based respiration, synthesis of plasmalogen and bile acids, beta- oxidation of very long chain fatty acids, and glyoxylate transamination. Biogenesis of peroxisomes appears to proceed by import of newly synthesized proteins into existing peroxisomes which enlarge and divide. Most matrix enzymes use an SKL (ser- lys- leu) tripeptide at the C- terminus as a targeting sequence, and the import of at least one, acyl- CoA oxidase, is ATP- dependent. Peroxisomal membrane proteins (PMP), as well as the peroxisomal matrix enzymes, are synthesized on free

cytoplasmic polysomes at their mature size. Disorders with defective peroxisome biogenesis include Zellweger syndrome (ZWS1; 214100) and neonatal adrenoleukodystrophy (OMIM Ref. No. 202370). In these disorders, many peroxisomal matrix proteins are mislocated in the cytosol, whereas others, such as PMP70, PMP22 (OMIM Ref. No. 601097), and thiolase precursor, are associated with irregularly shaped vesicles which may be defective peroxisomes or peroxisome precursors. These observations led to the hypothesis that the peroxisome biogenesis defects are due to defective import mechanisms for peroxisomal matrix enzymes. Somatic cell fusion studies indicated the existence of at least 11 complementation groups for ZS and related phenotypes (Moser et al., 1995). PMP70 was mapped to chromosome 1 by analysis of somatic cell hybrid DNAs (Gartner et al., 1992) and regionalized to 1p22- p21 by fluorescence in situ hybridization (1,2:Gartner et al., 1992, 1993). The gene encoding the mouse homolog of PMP70 (Pmp1) was located on chromosome 3 by interspecific backcross analysis.

[28031]

[28032] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[28033] Moser, A. B.; Rasmussen, M.; Naidu, S.; Watkins, P. A.; McGuinness, M.; Hajra, A. K.; Chen, G.; Raymond, G.; Liu, A.; Gordon, D.; Garnaas, K.; Walton, D. S.; Skjedal, O. H.; Guggenheim, M. A.; Jackson, L. G.; Elias, E. R.; Moser, H. W. : Phenotype of patients with peroxisomal disorders subdivided into sixteen complementation groups. J. Pe- diat. 127: 13- 22, 1995. ; and

[28034] Gartner, J.; Kearns, W.; Pearson, P.; Valle, D. : Characteri- zation and localization of the human 70- kD peroxisomal membrane protein (PMP70) gene. (Abstract) Am. J. Hum. Genet. 51 (suppl.

[28035] Further studies establishing the function and utilities of ABCD3 are found in John Hopkins OMIM database record ID 170995, and in cited publications listed in Table 5, which are hereby incorporated by refer- ence.Acyl-coenzyme a dehydrogenase, short/branched chain (ACADSB, Accession NP_001600.1) is another GAM189 target gene, herein designated TARGET GENE. ACADSB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ACADSB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4

illustrates the complementarity of the nucleotide sequences of ACADSB BINDING SITE, designated SEQ ID:16689, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28036] Another function of GAM189 is therefore inhibition of Acyl-coenzyme a dehydrogenase, short/branched chain (ACADSB, Accession NP_001600.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACADSB.

[28037] Acid phosphatase 5, tartrate resistant (ACP5, Accession NP_001602.1) is another GAM189 target gene, herein designated TARGET GENE. ACP5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ACP5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ACP5 BINDING SITE, designated SEQ ID:6638, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28038] Another function of GAM189 is therefore inhibition of Acid phosphatase 5, tartrate resistant (ACP5, Accession NP_001602.1) . Accordingly, utilities of GAM189 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with ACP5.

[28039] A disintegrin-like and metalloprotease (reprolysin type) with thrombospondin type 1 motif, 4 (ADAMTS4, Accession NP_005090.1) is another GAM189 target gene, herein designated TARGET GENE. ADAMTS4 BINDING SITE1 and ADAMTS4 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by ADAMTS4, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADAMTS4 BINDING SITE1 and ADAMTS4 BINDING SITE2, designated SEQ ID:1651 and SEQ ID:13757 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28040] Another function of GAM189 is therefore inhibition of A disintegrin-like and metalloprotease (reprolysin type) with thrombospondin type 1 motif, 4 (ADAMTS4, Accession NP_005090.1), a gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAMTS4.

[28041] The function of ADAMTS4 has been established by previous studies. Aggrecan degradation is an important factor in the erosion of articular cartilage in arthritic diseases. This degradation involves proteolysis of the aggrecan core protein near the N terminus, where 2 major cleavage sites have been identified. Matrix metalloproteinases (MMPs) cleave aggrecan between asn341 and phe342. Aggrecanase cleaves aggrecan between glu373 and ala374. Tortorella et al. (1999) purified and partially sequenced bovine aggrecanase- 1. By PCR with primers designed from a highly homologous murine EST, they cloned sequences from the homologous human cDNA. They assembled a full- length open reading frame from this initial human PCR product and from another human EST. The human aggrecanase- 1 (ADAMTS4) open reading frame encodes an 837- amino acid protein with a signal sequence, a propeptide domain, a catalytic domain, a disintegrin- like domain, and a C- terminal domain with a thrombospondin (TSP) type 1 motif. There is a conserved zinc- binding domain and a furin- sensitive sequence. The presence of a probable cysteine switch sequence in aggrecanase- 1 suggested that, like the MMPs, it is synthesized as a zymogen and is cleaved to remove the

propeptide domain and generate the mature active enzyme. A cloned portion of the bovine aggrecanase- 1 cDNA was 94% homologous to the human cDNA. Human aggrecanase- 1 cleaved bovine aggrecan between the glu373- ala374, but not the asn341- phe342, bond. Tortorella et al. (1999) stated that ADAMTS4 mRNA is present in brain, lung, and heart, and at very low levels in placenta and muscle tissues. By RT- PCR, Tortorella et al. (1999) observed upregulation of the aggrecanase- 1 message in stimulated human fetal chondrocytes and in joint tissues from adjuvant arthritic rats. Using a GeneBridge 4 radiation hybrid panel, Ishikawa et al. (1998) mapped the ADAMTS4 gene to chromosome 1. Hurskainen et al. (1999) mapped the human ADAMTS4 gene to chromosome 1 by somatic cell hybrid analysis. They mapped the mouse Adamts4 gene to chromosome 1.

[28042]

[28043] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28044] Tortorella, M. D.; Burn, T. C.; Pratta, M. A.; Abbaszade, I.; Hollis, J. M.; Liu, R.; Rosenfeld, S. A.; Copeland, R. A.; Decicco, C. P.; Wynn, R.; Rockwell, A.; Yang, F.; and 16 oth-

ers : Purification and cloning of aggrecanase- 1: a member of the ADAMTS family of proteins. Science 284: 1664-1666, 1999. ; and

[28045] Hurskainen, T. L.; Hirohata, S.; Seldin, M. F.; Apte, S. S. : ADAM- TS5, ADAM- TS6, and ADAM- TS7, novel members of a new family of zinc metalloproteases: general features and genomic dist.

[28046] Further studies establishing the function and utilities of ADAMTS4 are found in John Hopkins OMIM database record ID 603876, and in cited publications listed in Table 5, which are hereby incorporated by reference.Adenylate cyclase 6 (ADCY6, Accession NP_066193.1) is another GAM189 target gene, herein designated TARGET GENE. ADCY6 BINDING SITE1 and ADCY6 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by ADCY6, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADCY6 BINDING SITE1 and ADCY6 BINDING SITE2, designated SEQ ID:15161 and SEQ ID:16688 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28047] Another function of GAM189 is therefore inhibition of Adenylate cyclase 6 (ADCY6, Accession NP_066193.1), a gene which this a membrane- bound, ca(2+)- inhibitable adenylyl cyclase (by similarity). Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY6.

[28048] The function of ADCY6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM67.2.Adenylate cyclase 6 (ADCY6, Accession NP_056085.1) is another GAM189 target gene, herein designated TARGET GENE. ADCY6 BINDING SITE1 and ADCY6 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by ADCY6, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADCY6 BINDING SITE1 and ADCY6 BINDING SITE2, designated SEQ ID:15161 and SEQ ID:19456 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28049] Another function of GAM189 is therefore inhibition of

Adenylate cyclase 6 (ADCY6, Accession NP_056085.1), a gene which this a membrane- bound, ca(2+)- inhibitable adenylyl cyclase (by similarity). Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY6.

[28050] The function of ADCY6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM67.2.Agmatine ureohydrolase (agmatinase) (AGMAT, Accession NP_079034.2) is another GAM189 target gene, herein designated TARGET GENE. AGMAT BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AGMAT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AGMAT BINDING SITE, designated SEQ ID:9193, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28051] Another function of GAM189 is therefore inhibition of Agmatine ureohydrolase (agmatinase) (AGMAT, Accession NP_079034.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with AGMAT.

[28052] Aryl hydrocarbon receptor (AHR, Accession NP_001612.1) is another GAM189 target gene, herein designated TARGET GENE. AHR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AHR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AHR BINDING SITE, designated SEQ ID:8217, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28053] Another function of GAM189 is therefore inhibition of Aryl hydrocarbon receptor (AHR, Accession NP_001612.1), a gene which plays a role in modulating carcinogenesis through the induction of xenobiotic- metabolizing enzymes and therefore may be associated with Stomach tumors. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Stomach tumors, and of other diseases and clinical conditions associated with AHR.

[28054] The function of AHR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Absent in melanoma 1 (AIM1, Accession

XP_166300.1) is another GAM189 target gene, herein designated TARGET GENE. AIM1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AIM1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AIM1 BINDING SITE, designated SEQ ID:16864, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28055] Another function of GAM189 is therefore inhibition of Absent in melanoma 1 (AIM1, Accession XP_166300.1), a gene which is altered in association with tumor suppression in a model of human melanoma and therefore may be associated with Malignant melanoma. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Malignant melanoma, and of other diseases and clinical conditions associated with AIM1.

[28056] The function of AIM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM136.1.Aldo-keto reductase family 1, member d1 (delta 4-3-ketosteroid-5-beta-reductase) (AKR1D1, Ac-

cession NP_005980.1) is another GAM189 target gene, herein designated TARGET GENE. AKR1D1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AKR1D1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AKR1D1 BINDING SITE, designated SEQ ID:8063, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28057] Another function of GAM189 is therefore inhibition of Aldo-keto reductase family 1, member d1 (delta 4-3-ketosteroid-5-beta-reductase) (AKR1D1, Accession NP_005980.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKR1D1.

[28058] Aldehyde dehydrogenase 1 family, member b1 (ALDH1B1, Accession NP_000683.3) is another GAM189 target gene, herein designated TARGET GENE. ALDH1B1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ALDH1B1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the com-

plementarity of the nucleotide sequences of ALDH1B1 BINDING SITE, designated SEQ ID:2153, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28059] Another function of GAM189 is therefore inhibition of Aldehyde dehydrogenase 1 family, member b1 (ALDH1B1, Accession NP_000683.3) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALDH1B1.

[28060] Arachidonate 15-lipoxygenase (ALOX15, Accession NP_001131.1) is another GAM189 target gene, herein designated TARGET GENE. ALOX15 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ALOX15, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ALOX15 BINDING SITE, designated SEQ ID:19939, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28061] Another function of GAM189 is therefore inhibition of Arachidonate 15-lipoxygenase (ALOX15, Accession NP_001131.1), a gene which converts arachidonic acid to

15s- hydroperoxyeicosatetraenoic acid. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALOX15.

[28062] The function of ALOX15 has been established by previous studies. Yoshimoto et al. (1990) found that the amino acid sequence of human reticulocyte 15- lipoxygenase (Sigal et al., 1988) showed 86% identity with that of porcine leukocyte 12- lipoxygenase (OMIM Ref. No. 152391). Sigal et al. (1988) found 61% sequence similarity between 15-lipoxygenase and 5- lipoxygenase (OMIM Ref. No. 152390). This suggests that in the human 12- lipoxygenase is more closely related evolutionarily to 15- lipoxygenase than to 5- lipoxygenase, even though the comparisons are made between human and porcine enzymes. By PCR analysis of a human- hamster somatic hybrid DNA panel, Funk et al. (1992) demonstrated that genes for 12-lipoxygenase and 15- lipoxygenase are located on human chromosome 17, whereas the most unrelated lipoxygenase (5- lipoxygenase) was mapped to chromosome 10. Kelavkar and Badr (1999) stated that the ALOX15 gene maps to 17p13.3 in close proximity to the tumor- suppressor gene TP53 (OMIM Ref. No. 191170). The ALOX15

gene product is implicated in antiinflammation, membrane remodeling, and cancer development/metastasis. Kelavkar and Badr (1999) described experiments yielding data that supported the hypothesis that loss of the TP53 gene, or gain- of- function activities resulting from the expression of its mutant forms, regulates ALOX15 promoter activity in human and in mouse, albeit in directionally opposite manners. These studies defined a direct link between ALOX15 gene activity and an established tumor-suppressor gene located in close chromosomal proximity. Kelavkar and Badr (1999) referred to this as evidence that 15- lipoxygenase is a mutator gene.

[28063]

[28064] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28065] Kelavkar, U. P.; Badr, K. F. : Effects of mutant p53 expression on human 15- lipoxygenase- promoter activity and murine 12/15- lipoxygenase gene expression: evidence that 15- lipoxygenase is a mutator gene. Proc. Nat. Acad. Sci. 96: 4378- 4383, 1999. ; and

[28066] Yoshimoto, T.; Suzuki, H.; Yamamoto, S.; Takai, T.; Yokoyama, C.; Tanabe, T. : Cloning and sequence analysis

of the cDNA for arachidonate 12- lipoxygenase of porcine leukocytes. Proc. Na.

[28067] Further studies establishing the function and utilities of ALOX15 are found in John Hopkins OMIM database record ID 152392, and in cited publications listed in Table 5, which are hereby incorporated by reference.AMID (Accession NP_116186.1) is another GAM189 target gene, herein designated TARGET GENE. AMID BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AMID, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AMID BINDING SITE, designated SEQ ID:5895, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28068] Another function of GAM189 is therefore inhibition of AMID (Accession NP_116186.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMID.

[28069] Ankyrin repeat domain 6 (ANKRD6, Accession NP_055757.1) is another GAM189 target gene, herein designated TARGET GENE. ANKRD6 BINDING SITE is a tar-

get binding site found in the 3` untranslated region of mRNA encoded by ANKRD6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ANKRD6 BINDING SITE, designated SEQ ID:1746, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28070] Another function of GAM189 is therefore inhibition of Ankyrin repeat domain 6 (ANKRD6, Accession NP_055757.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANKRD6.

[28071] Adaptor-related protein complex 3, sigma 2 subunit (AP3S2, Accession NP_005820.1) is another GAM189 target gene, herein designated TARGET GENE. AP3S2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AP3S2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AP3S2 BINDING SITE, designated SEQ ID:19874, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA,

also designated SEQ ID:246.

[28072] Another function of GAM189 is therefore inhibition of Adaptor-related protein complex 3, sigma 2 subunit (AP3S2, Accession NP_005820.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP3S2.

[28073] Apoptotic protease activating factor (APAF1, Accession NP_001151.1) is another GAM189 target gene, herein designated TARGET GENE. APAF1 BINDING SITE1 and APAF1 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by APAF1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APAF1 BINDING SITE1 and APAF1 BINDING SITE2, designated SEQ ID:16578 and SEQ ID:19360 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28074] Another function of GAM189 is therefore inhibition of Apoptotic protease activating factor (APAF1, Accession NP_001151.1), a gene which functions in the mitochondrial apoptotic pathway that leads to caspase 9 dependent

activation of caspase 3 and therefore may be associated with Cancer. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Cancer, and of other diseases and clinical conditions associated with APAF1.

[28075] The function of APAF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Apoptotic protease activating factor (APAF1, Accession NP_037361.1) is another GAM189 target gene, herein designated TARGET GENE. APAF1 BINDING SITE1 and APAF1 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by APAF1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APAF1 BINDING SITE1 and APAF1 BINDING SITE2, designated SEQ ID:19360 and SEQ ID:16578 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28076] Another function of GAM189 is therefore inhibition of Apoptotic protease activating factor (APAF1, Accession NP_037361.1), a gene which functions in the mitochon-

drial apoptotic pathway that leads to caspase 9 dependent activation of caspase 3 and therefore may be associated with Cancer. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Cancer, and of other diseases and clinical conditions associated with APAF1.

[28077] The function of APAF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.APM1 (Accession NP_004788.1) is another GAM189 target gene, herein designated TARGET GENE. APM1 BINDING SITE1 and APM1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by APM1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APM1 BINDING SITE1 and APM1 BINDING SITE2, designated SEQ ID:20035 and SEQ ID:5598 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28078] Another function of GAM189 is therefore inhibition of APM1 (Accession NP_004788.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APM1.

[28079] Apolipoprotein b mrna editing enzyme, catalytic polypeptide-like 3f (APOBEC3F, Accession NP_660341.2) is another GAM189 target gene, herein designated TARGET GENE. APOBEC3F BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APOBEC3F, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APOBEC3F BINDING SITE, designated SEQ ID:5622, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28080] Another function of GAM189 is therefore inhibition of Apolipoprotein b mrna editing enzyme, catalytic polypeptide-like 3f (APOBEC3F, Accession NP_660341.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOBEC3F.

[28081] Apolipoprotein l, 1 (APOL1, Accession NP_663318.1) is another GAM189 target gene, herein designated TARGET GENE. APOL1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by APOL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APOL1 BINDING SITE, designated SEQ ID:9574, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28082] Another function of GAM189 is therefore inhibition of Apolipoprotein l, 1 (APOL1, Accession NP_663318.1), a gene which may participate in reverse cholesterol transport from peripheral cells to the liver. and therefore may be associated with Schizophrenia. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Schizophrenia, and of other diseases and clinical conditions associated with APOL1.

[28083] The function of APOL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Apolipoprotein l, 1 (APOL1, Accession NP_003652.2) is another GAM189 target gene, herein designated TARGET GENE. APOL1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by APOL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates

the complementarity of the nucleotide sequences of APOL1 BINDING SITE, designated SEQ ID:9574, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28084] Another function of GAM189 is therefore inhibition of Apolipoprotein l, 1 (APOL1, Accession NP_003652.2), a gene which may participate in reverse cholesterol transport from peripheral cells to the liver. and therefore may be associated with Schizophrenia. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Schizophrenia, and of other diseases and clinical conditions associated with APOL1.

[28085] The function of APOL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Apolipoprotein l, 2 (APOL2, Accession NP_663612.1) is another GAM189 target gene, herein designated TARGET GENE. APOL2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by APOL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

APOL2 BINDING SITE, designated SEQ ID:8064, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28086] Another function of GAM189 is therefore inhibition of Apolipoprotein l, 2 (APOL2, Accession NP_663612.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOL2.

[28087] Apolipoprotein l, 2 (APOL2, Accession NP_112092.1) is another GAM189 target gene, herein designated TARGET GENE. APOL2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by APOL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APOL2 BINDING SITE, designated SEQ ID:8064, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28088] Another function of GAM189 is therefore inhibition of Apolipoprotein l, 2 (APOL2, Accession NP_112092.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions as-

sociated with APOL2.

[28089] Amyloid beta precursor protein (cytoplasmic tail) binding protein 2 (APPBP2, Accession NP_006371.2) is another GAM189 target gene, herein designated TARGET GENE. APPBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APPBP2 BINDING SITE, designated SEQ ID:4095, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28090] Another function of GAM189 is therefore inhibition of Amyloid beta precursor protein (cytoplasmic tail) binding protein 2 (APPBP2, Accession NP_006371.2), a gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore may be associated with Alzheimer's disease. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Alzheimer's disease, and of other diseases and clinical conditions associated with APPBP2.

[28091] The function of APPBP2 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to GAM130.1.APPL (Accession NP_036228.1) is another GAM189 target gene, herein designated TARGET GENE. APPL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APPL BINDING SITE, designated SEQ ID:12068, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28092] Another function of GAM189 is therefore inhibition of APPL (Accession NP_036228.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APPL.

[28093] Aquaporin 2 (collecting duct) (AQP2, Accession NP_000477.1) is another GAM189 target gene, herein designated TARGET GENE. AQP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AQP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AQP2 BINDING SITE, designated

SEQ ID:18318, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28094] Another function of GAM189 is therefore inhibition of Aquaporin 2 (collecting duct) (AQP2, Accession NP_000477.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AQP2.

[28095] Aquaporin 6, kidney specific (AQP6, Accession NP_445738.1) is another GAM189 target gene, herein designated TARGET GENE. AQP6 BINDING SITE1 through AQP6 BINDING SITE3 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by AQP6, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AQP6 BINDING SITE1 through AQP6 BINDING SITE3, designated SEQ ID:3169, SEQ ID:3169 and SEQ ID:7869 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28096] Another function of GAM189 is therefore inhibition of Aquaporin 6, kidney specific (AQP6, Accession

NP_445738.1), a gene which participates in distinct physiologic function such as glomerular filtration, tubular endocytosis, and acid- base metabolism. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AQP6.

[28097] The function of AQP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM51.1.Aquaporin 6, kidney specific (AQP6, Accession NP_001643.1) is another GAM189 target gene, herein designated TARGET GENE. AQP6 BINDING SITE1 through AQP6 BINDING SITE3 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by AQP6, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AQP6 BINDING SITE1 through AQP6 BINDING SITE3, designated SEQ ID:8069, SEQ ID:13747 and SEQ ID:6901 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28098] Another function of GAM189 is therefore inhibition of

Aquaporin 6, kidney specific (AQP6, Accession NP_001643.1), a gene which participates in distinct physiologic function such as glomerular filtration, tubular endocytosis, and acid- base metabolism. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AQP6.

[28099] The function of AQP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM51.1.Rho gtpase activating protein 1 (ARHGAP1, Accession NP_004299.1) is another GAM189 target gene, herein designated TARGET GENE. ARHGAP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ARHGAP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARHGAP1 BINDING SITE, designated SEQ ID:4096, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28100] Another function of GAM189 is therefore inhibition of Rho gtpase activating protein 1 (ARHGAP1, Accession

NP_004299.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP1.

[28101] ARHGAP11A (Accession NP_055598.1) is another GAM189 target gene, herein designated TARGET GENE. ARHGAP11A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ARHGAP11A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARHGAP11A BINDING SITE, designated SEQ ID:17742, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28102] Another function of GAM189 is therefore inhibition of ARHGAP11A (Accession NP_055598.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP11A.

[28103] ARK5 (Accession NP_055655.1) is another GAM189 target gene, herein designated TARGET GENE. ARK5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ARK5, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARK5 BINDING SITE, designated SEQ ID:17859, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28104] Another function of GAM189 is therefore inhibition of ARK5 (Accession NP_055655.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARK5.

[28105] ARPP-19 (Accession NP_006619.1) is another GAM189 target gene, herein designated TARGET GENE. ARPP-19 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ARPP-19, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARPP-19 BINDING SITE, designated SEQ ID:944, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28106] Another function of GAM189 is therefore inhibition of ARPP-19 (Accession NP_006619.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with ARPP-19.

[28107] Ankyrin repeat and socs box-containing 16 (ASB16, Accession NP_543139.4) is another GAM189 target gene, herein designated TARGET GENE. ASB16 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ASB16, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ASB16 BINDING SITE, designated SEQ ID:14722, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28108] Another function of GAM189 is therefore inhibition of Ankyrin repeat and socs box-containing 16 (ASB16, Accession NP_543139.4) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASB16.

[28109] Ankyrin repeat and socs box-containing 6 (ASB6, Accession NP_821066.1) is another GAM189 target gene, herein designated TARGET GENE. ASB6 BINDING SITE1 and ASB6 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by

ASB6, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ASB6 BINDING SITE1 and ASB6 BINDING SITE2, designated SEQ ID:2196 and SEQ ID:10305 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28110] Another function of GAM189 is therefore inhibition of Ankyrin repeat and socs box-containing 6 (ASB6, Accession NP_821066.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASB6.

[28111] Ankyrin repeat and socs box-containing 6 (ASB6, Accession NP_060343.1) is another GAM189 target gene, herein designated TARGET GENE. ASB6 BINDING SITE1 and ASB6 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by ASB6, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ASB6 BINDING SITE1 and ASB6 BINDING SITE2, designated SEQ ID:10305 and SEQ ID:2196 respectively, to the nucleotide sequence of GAM189 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:246.

[28112] Another function of GAM189 is therefore inhibition of Ankyrin repeat and socs box-containing 6 (ASB6, Accession NP_060343.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASB6.

[28113] ASE-1 (Accession NP_036231.1) is another GAM189 target gene, herein designated TARGET GENE. ASE-1 BINDING SITE1 and ASE-1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by ASE-1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ASE-1 BINDING SITE1 and ASE-1 BINDING SITE2, designated SEQ ID:1741 and SEQ ID:3101 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28114] Another function of GAM189 is therefore inhibition of ASE-1 (Accession NP_036231.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASE-1.

[28115] ATF7IP2 (Accession NP_079273.1) is another GAM189 target gene, herein designated TARGET GENE. ATF7IP2 BIND-

ING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ATF7IP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATF7IP2 BINDING SITE, designated SEQ ID:9602, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28116] Another function of GAM189 is therefore inhibition of ATF7IP2 (Accession NP_079273.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATF7IP2.

[28117] Ataxia telangiectasia mutated (includes complementation groups a, c and d) (ATM, Accession NP_612150.1) is another GAM189 target gene, herein designated TARGET GENE. ATM BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ATM, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATM BINDING SITE, designated SEQ ID:1837, to the nucleotide sequence of

GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28118] Another function of GAM189 is therefore inhibition of Ataxia telangiectasia mutated (includes complementation groups a, c and d) (ATM, Accession NP_612150.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATM.

[28119] Atpase, na+/k+ transporting, beta 2 polypeptide (ATP1B2, Accession NP_001669.1) is another GAM189 target gene, herein designated TARGET GENE. ATP1B2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ATP1B2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP1B2 BINDING SITE, designated SEQ ID:16916, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28120] Another function of GAM189 is therefore inhibition of Atpase, na+/k+ transporting, beta 2 polypeptide (ATP1B2, Accession NP_001669.1), a gene which catalyzes the hydrolysis of ATP coupled with the exchange of Na +/K+

ions across the plasma membrane. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1B2.

[28121] The function of ATP1B2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM130.1.Atpase, (na+)/k+ transporting, beta 4 polypeptide (ATP1B4, Accession NP_036201.1) is another GAM189 target gene, herein designated TARGET GENE. ATP1B4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ATP1B4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP1B4 BINDING SITE, designated SEQ ID:13042, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28122] Another function of GAM189 is therefore inhibition of Atpase, (na+)/k+ transporting, beta 4 polypeptide (ATP1B4, Accession NP_036201.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1B4.

[28123] Atpase, h+ transporting, lysosomal 38kda, v0 subunit d

isoform 2 (ATP6V0D2, Accession NP_689778.1) is another GAM189 target gene, herein designated TARGET GENE. ATP6V0D2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ATP6V0D2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP6V0D2 BINDING SITE, designated SEQ ID:15039, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28124] Another function of GAM189 is therefore inhibition of Atpase, h+ transporting, lysosomal 38kda, v0 subunit d isoform 2 (ATP6V0D2, Accession NP_689778.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP6V0D2.

[28125] ATP6V1A (Accession NP_001681.2) is another GAM189 target gene, herein designated TARGET GENE. ATP6V1A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ATP6V1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of ATP6V1A BINDING SITE, designated SEQ ID:18868, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28126] Another function of GAM189 is therefore inhibition of ATP6V1A (Accession NP_001681.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP6V1A.

[28127] Atpase, cu++ transporting, alpha polypeptide (menkes syndrome) (ATP7A, Accession NP_000043.1) is another GAM189 target gene, herein designated TARGET GENE. ATP7A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ATP7A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP7A BINDING SITE, designated SEQ ID:4112, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28128] Another function of GAM189 is therefore inhibition of Atpase, cu++ transporting, alpha polypeptide (menkes syndrome) (ATP7A, Accession NP_000043.1) . Accordingly,

utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP7A.

[28129] Atpase, class i, type 8b, member 2 (ATP8B2, Accession XP_290875.1) is another GAM189 target gene, herein designated TARGET GENE. ATP8B2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ATP8B2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP8B2 BINDING SITE, designated SEQ ID:8634, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28130] Another function of GAM189 is therefore inhibition of Atpase, class i, type 8b, member 2 (ATP8B2, Accession XP_290875.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP8B2.

[28131] Axl receptor tyrosine kinase (AXL, Accession NP_068713.2) is another GAM189 target gene, herein designated TARGET GENE. AXL BINDING SITE is a target binding site found in the 3` untranslated region of multi-

ple transcripts of mRNA encoded by AXL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AXL BINDING SITE, designated SEQ ID:11802, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28132] Another function of GAM189 is therefore inhibition of Axl receptor tyrosine kinase (AXL, Accession NP_068713.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AXL.

[28133] Axl receptor tyrosine kinase (AXL, Accession NP_001690.2) is another GAM189 target gene, herein designated TARGET GENE. AXL BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AXL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AXL BINDING SITE, designated SEQ ID:11802, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28134] Another function of GAM189 is therefore inhibition of Axl receptor tyrosine kinase (AXL, Accession NP_001690.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AXL.

[28135] Udp-gal:betaglcnac beta 1,4- galactosyltransferase, polypeptide 4 (B4GALT4, Accession NP_003769.1) is another GAM189 target gene, herein designated TARGET GENE. B4GALT4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by B4GALT4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of B4GALT4 BINDING SITE, designated SEQ ID:11028, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28136] Another function of GAM189 is therefore inhibition of Udp-gal:betaglcnac beta 1,4- galactosyltransferase, polypeptide 4 (B4GALT4, Accession NP_003769.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B4GALT4.

[28137] Xylosylprotein beta 1,4-galactosyltransferase, polypeptide 7 (galactosyltransferase i) (B4GALT7, Accession NP_009186.1) is another GAM189 target gene, herein designated TARGET GENE. B4GALT7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by B4GALT7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of B4GALT7 BINDING SITE, designated SEQ ID:18475, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28138] Another function of GAM189 is therefore inhibition of Xylosylprotein beta 1,4-galactosyltransferase, polypeptide 7 (galactosyltransferase i) (B4GALT7, Accession NP_009186.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B4GALT7.

[28139] BA108L7.2 (Accession NP_112233.2) is another GAM189 target gene, herein designated TARGET GENE. BA108L7.2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BA108L7.2, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BA108L7.2 BINDING SITE, designated SEQ ID:10888, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28140] Another function of GAM189 is therefore inhibition of BA108L7.2 (Accession NP_112233.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BA108L7.2.

[28141] Beta-site app-cleaving enzyme 2 (BACE2, Accession NP_036237.2) is another GAM189 target gene, herein designated TARGET GENE. BACE2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BACE2 BINDING SITE, designated SEQ ID:11052, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28142] Another function of GAM189 is therefore inhibition of Beta-site app-cleaving enzyme 2 (BACE2, Accession

NP_036237.2), a gene which cleaves intracellularly the b-secretase site of amyloid precursor protein and therefore may be associated with Alzheimer's disease and down syndrome. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Alzheimer's disease and down syndrome, and of other diseases and clinical conditions associated with BACE2.

[28143] The function of BACE2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM139.1.Beta-site app-cleaving enzyme 2 (BACE2, Accession NP_620476.1) is another GAM189 target gene, herein designated TARGET GENE. BACE2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BACE2 BINDING SITE, designated SEQ ID:11052, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28144] Another function of GAM189 is therefore inhibition of Beta-site app-cleaving enzyme 2 (BACE2, Accession

NP_620476.1), a gene which cleaves intracellularly the b-secretase site of amyloid precursor protein and therefore may be associated with Alzheimer's disease and down syndrome. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Alzheimer's disease and down syndrome, and of other diseases and clinical conditions associated with BACE2.

[28145] The function of BACE2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM139.1.Beta-site app-cleaving enzyme 2 (BACE2, Accession NP_620477.1) is another GAM189 target gene, herein designated TARGET GENE. BACE2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BACE2 BINDING SITE, designated SEQ ID:11052, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28146] Another function of GAM189 is therefore inhibition of Beta-site app-cleaving enzyme 2 (BACE2, Accession

NP_620477.1), a gene which cleaves intracellularly the b-secretase site of amyloid precursor protein and therefore may be associated with Alzheimer's disease and down syndrome. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Alzheimer's disease and down syndrome, and of other diseases and clinical conditions associated with BACE2.

[28147] The function of BACE2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM139.1.Bcl2-associated athanogene 5 (BAG5, Accession NP_004864.1) is another GAM189 target gene, herein designated TARGET GENE. BAG5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BAG5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BAG5 BINDING SITE, designated SEQ ID:5695, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28148] Another function of GAM189 is therefore inhibition of Bcl2-associated athanogene 5 (BAG5, Accession

NP_004864.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAG5.

[28149] BART1 (Accession NP_036238.1) is another GAM189 target gene, herein designated TARGET GENE. BART1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BART1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BART1 BINDING SITE, designated SEQ ID:16830, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28150] Another function of GAM189 is therefore inhibition of BART1 (Accession NP_036238.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BART1.

[28151] Bromodomain adjacent to zinc finger domain, 2a (BAZ2A, Accession NP_038477.1) is another GAM189 target gene, herein designated TARGET GENE. BAZ2A BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by BAZ2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BAZ2A BINDING SITE, designated SEQ ID:8852, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28152] Another function of GAM189 is therefore inhibition of Bromodomain adjacent to zinc finger domain, 2a (BAZ2A, Accession NP_038477.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAZ2A.

[28153] BCAP31 (Accession NP_005736.2) is another GAM189 target gene, herein designated TARGET GENE. BCAP31 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BCAP31, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BCAP31 BINDING SITE, designated SEQ ID:4861, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28154] Another function of GAM189 is therefore inhibition of BCAP31 (Accession NP_005736.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with BCAP31.

[28155] B-cell cll/lymphoma 10 (BCL10, Accession NP_003912.1) is another GAM189 target gene, herein designated TARGET GENE. BCL10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BCL10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BCL10 BINDING SITE, designated SEQ ID:19576, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28156] Another function of GAM189 is therefore inhibition of B-cell cll/lymphoma 10 (BCL10, Accession NP_003912.1), a gene which is a positive regulator of lymphocyte proliferation, NF- kappaB activator. and therefore may be associated with Malt lymphoma, follicular lymphoma. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Malt lymphoma, follicular lymphoma, and of other diseases and clinical conditions associated with BCL10.

[28157] The function of BCL10 and its association with various

diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM136.1.B double prime 1, subunit of rna polymerase iii transcription initiation factor iiib (BDP1, Accession NP_060899.1) is another GAM189 target gene, herein designated TARGET GENE. BDP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BDP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BDP1 BINDING SITE, designated SEQ ID:19556, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28158] Another function of GAM189 is therefore inhibition of B double prime 1, subunit of rna polymerase iii transcription initiation factor iiib (BDP1, Accession NP_060899.1), a gene which activates RNA polymerase III transcription. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BDP1.

[28159] The function of BDP1 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to GAM146.1.BENE (Accession NP_005425.1) is another GAM189 target gene, herein designated TARGET GENE. BENE BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BENE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BENE BINDING SITE, designated SEQ ID:6009, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28160] Another function of GAM189 is therefore inhibition of BENE (Accession NP_005425.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BENE.

[28161] BHD (Accession NP_659434.2) is another GAM189 target gene, herein designated TARGET GENE. BHD BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BHD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BHD BINDING SITE, designated SEQ ID:9036, to

the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28162] Another function of GAM189 is therefore inhibition of BHD (Accession NP_659434.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BHD.

[28163] BMF (Accession NP_277038.1) is another GAM189 target gene, herein designated TARGET GENE. BMF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BMF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BMF BINDING SITE, designated SEQ ID:759, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28164] Another function of GAM189 is therefore inhibition of BMF (Accession NP_277038.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BMF.

[28165] BNIP-S (Accession NP_612122.1) is another GAM189 target gene, herein designated TARGET GENE. BNIP-S BINDING SITE is a target binding site found in the 3` untrans-

lated region of multiple transcripts of mRNA encoded by BNIP-S, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BNIP-S BINDING SITE, designated SEQ ID:5845, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28166] Another function of GAM189 is therefore inhibition of BNIP-S (Accession NP_612122.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BNIP-S.

[28167] BRIP1 (Accession NP_114432.1) is another GAM189 target gene, herein designated TARGET GENE. BRIP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BRIP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BRIP1 BINDING SITE, designated SEQ ID:13904, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28168] Another function of GAM189 is therefore inhibition of BRIP1 (Accession NP_114432.1) . Accordingly, utilities of

GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRIP1.

[28169] Butyrophilin, subfamily 3, member a1 (BTN3A1, Accession NP_008979.2) is another GAM189 target gene, herein designated TARGET GENE. BTN3A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BTN3A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BTN3A1 BINDING SITE, designated SEQ ID:2067, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28170] Another function of GAM189 is therefore inhibition of Butyrophilin, subfamily 3, member a1 (BTN3A1, Accession NP_008979.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTN3A1.

[28171] BXDC1 (Accession XP_166303.1) is another GAM189 target gene, herein designated TARGET GENE. BXDC1 BINDING SITE1 and BXDC1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by BXDC1, corresponding to target binding sites such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BXDC1 BINDING SITE1 and BXDC1 BINDING SITE2, designated SEQ ID:4549 and SEQ ID:12129 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28172] Another function of GAM189 is therefore inhibition of BXDC1 (Accession XP_166303.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BXDC1.

[28173] Chromosome 11 open reading frame 17 (C11orf17, Accession NP_065693.2) is another GAM189 target gene, herein designated TARGET GENE. C11orf17 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C11orf17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C11orf17 BINDING SITE, designated SEQ ID:11525, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28174] Another function of GAM189 is therefore inhibition of Chromosome 11 open reading frame 17 (C11orf17, Ac-

cession NP_065693.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf17.

[28175] Chromosome 13 open reading frame 1 (C13orf1, Accession NP_065189.1) is another GAM189 target gene, herein designated TARGET GENE. C13orf1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C13orf1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C13orf1 BINDING SITE, designated SEQ ID:5746, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28176] Another function of GAM189 is therefore inhibition of Chromosome 13 open reading frame 1 (C13orf1, Accession NP_065189.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C13orf1.

[28177] Chromosome 14 open reading frame 1 (C14orf1, Accession NP_009107.1) is another GAM189 target gene, herein designated TARGET GENE. C14orf1 BINDING SITE is a target binding site found in the 3` untranslated region of

mRNA encoded by C14orf1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf1 BINDING SITE, designated SEQ ID:12744, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28178] Another function of GAM189 is therefore inhibition of Chromosome 14 open reading frame 1 (C14orf1, Accession NP_009107.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf1.

[28179] C14orf113 (Accession NP_060100.1) is another GAM189 target gene, herein designated TARGET GENE. C14orf113 BINDING SITE1 and C14orf113 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by C14orf113, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf113 BINDING SITE1 and C14orf113 BINDING SITE2, designated SEQ ID:18863 and SEQ ID:5052 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:246.

[28180] Another function of GAM189 is therefore inhibition of C14orf113 (Accession NP_060100.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf113.

[28181] C14orf143 (Accession NP_660274.1) is another GAM189 target gene, herein designated TARGET GENE. C14orf143 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C14orf143, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf143 BINDING SITE, designated SEQ ID:17955, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28182] Another function of GAM189 is therefore inhibition of C14orf143 (Accession NP_660274.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf143.

[28183] C14orf92 (Accession NP_055643.1) is another GAM189 target gene, herein designated TARGET GENE. C14orf92

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C14orf92, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf92 BINDING SITE, designated SEQ ID:14861, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28184] Another function of GAM189 is therefore inhibition of C14orf92 (Accession NP_055643.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf92.

[28185] Chromosome 1 open reading frame 24 (C1orf24, Accession NP_443198.1) is another GAM189 target gene, herein designated TARGET GENE. C1orf24 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by C1orf24, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1orf24 BINDING SITE, designated SEQ ID:19538, to the nucleotide sequence of GAM189 RNA, herein designated

GAM RNA, also designated SEQ ID:246.

[28186] Another function of GAM189 is therefore inhibition of Chromosome 1 open reading frame 24 (C1orf24, Accession NP_443198.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf24.

[28187] C1q and tumor necrosis factor related protein 6 (C1QTNF6, Accession NP_114116.2) is another GAM189 target gene, herein designated TARGET GENE. C1QTNF6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C1QTNF6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1QTNF6 BINDING SITE, designated SEQ ID:14882, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28188] Another function of GAM189 is therefore inhibition of C1q and tumor necrosis factor related protein 6 (C1QTNF6, Accession NP_114116.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QTNF6.

[28189] Chromosome 20 open reading frame 147 (C20orf147, Ac-

cession NP_689880.1) is another GAM189 target gene, herein designated TARGET GENE. C20orf147 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C20orf147, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf147 BINDING SITE, designated SEQ ID:16257, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28190] Another function of GAM189 is therefore inhibition of Chromosome 20 open reading frame 147 (C20orf147, Accession NP_689880.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf147.

[28191] Chromosome 21 open reading frame 67 (C21orf67, Accession NP_478068.1) is another GAM189 target gene, herein designated TARGET GENE. C21orf67 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by C21orf67, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C21orf67

BINDING SITE, designated SEQ ID:6569, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28192] Another function of GAM189 is therefore inhibition of Chromosome 21 open reading frame 67 (C21orf67, Accession NP_478068.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf67.

[28193] Chromosome 22 open reading frame 19 (C22orf19, Accession NP_003669.2) is another GAM189 target gene, herein designated TARGET GENE. C22orf19 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C22orf19, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C22orf19 BINDING SITE, designated SEQ ID:18897, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28194] Another function of GAM189 is therefore inhibition of Chromosome 22 open reading frame 19 (C22orf19, Accession NP_003669.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with C22orf19.

[28195] C4orf9 (Accession XP_035572.1) is another GAM189 target gene, herein designated TARGET GENE. C4orf9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C4orf9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C4orf9 BINDING SITE, designated SEQ ID:15574, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28196] Another function of GAM189 is therefore inhibition of C4orf9 (Accession XP_035572.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C4orf9.

[28197] Chromosome 6 open reading frame 33 (C6orf33, Accession NP_588608.1) is another GAM189 target gene, herein designated TARGET GENE. C6orf33 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C6orf33, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C6orf33 BIND-

ING SITE, designated SEQ ID:6896, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28198] Another function of GAM189 is therefore inhibition of Chromosome 6 open reading frame 33 (C6orf33, Accession NP_588608.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf33.

[28199] C6orf5 (Accession NP_056339.2) is another GAM189 target gene, herein designated TARGET GENE. C6orf5 BINDING SITE1 and C6orf5 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by C6orf5, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C6orf5 BINDING SITE1 and C6orf5 BINDING SITE2, designated SEQ ID:10099 and SEQ ID:12805 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28200] Another function of GAM189 is therefore inhibition of C6orf5 (Accession NP_056339.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with C6orf5.

[28201] C6orf57 (Accession NP_660310.1) is another GAM189 target gene, herein designated TARGET GENE. C6orf57 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C6orf57, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C6orf57 BINDING SITE, designated SEQ ID:2114, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28202] Another function of GAM189 is therefore inhibition of C6orf57 (Accession NP_660310.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf57.

[28203] Complement component 7 (C7, Accession NP_000578.1) is another GAM189 target gene, herein designated TARGET GENE. C7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide se-

quences of C7 BINDING SITE, designated SEQ ID:17778, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28204] Another function of GAM189 is therefore inhibition of Complement component 7 (C7, Accession NP_000578.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C7.

[28205] Chromosome 9 open reading frame 5 (C9orf5, Accession NP_114401.1) is another GAM189 target gene, herein designated TARGET GENE. C9orf5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C9orf5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C9orf5 BINDING SITE, designated SEQ ID:14258, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28206] Another function of GAM189 is therefore inhibition of Chromosome 9 open reading frame 5 (C9orf5, Accession NP_114401.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with C9orf5.

[28207] Chromosome 9 open reading frame 9 (C9orf9, Accession NP_061829.2) is another GAM189 target gene, herein designated TARGET GENE. C9orf9 BINDING SITE1 and C9orf9 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by C9orf9, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C9orf9 BINDING SITE1 and C9orf9 BINDING SITE2, designated SEQ ID:11520 and SEQ ID:5477 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28208] Another function of GAM189 is therefore inhibition of Chromosome 9 open reading frame 9 (C9orf9, Accession NP_061829.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf9.

[28209] CAB2 (Accession NP_219487.2) is another GAM189 target gene, herein designated TARGET GENE. CAB2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CAB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II

or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CAB2 BINDING SITE, designated SEQ ID:9181, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28210] Another function of GAM189 is therefore inhibition of CAB2 (Accession NP_219487.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAB2.

[28211] Calcium binding protein 4 (CABP4, Accession NP_660201.1) is another GAM189 target gene, herein designated TARGET GENE. CABP4 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CABP4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CABP4 BINDING SITE, designated SEQ ID:7624, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28212] Another function of GAM189 is therefore inhibition of Calcium binding protein 4 (CABP4, Accession NP_660201.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with CABP4.

[28213] Calneuron 1 (CALN1, Accession NP_113656.1) is another GAM189 target gene, herein designated TARGET GENE. CALN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CALN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CALN1 BINDING SITE, designated SEQ ID:17850, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28214] Another function of GAM189 is therefore inhibition of Calneuron 1 (CALN1, Accession NP_113656.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALN1.

[28215] Calcium modulating ligand (CAMLG, Accession NP_001736.1) is another GAM189 target gene, herein designated TARGET GENE. CAMLG BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CAMLG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of CAMLG BINDING SITE, designated SEQ ID:18944, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28216] Another function of GAM189 is therefore inhibition of Calcium modulating ligand (CAMLG, Accession NP_001736.1), a gene which is likely involved in the mobilization of calcium as a result of the tcr/cd3 complex interaction. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMLG.

[28217] The function of CAMLG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM130.1.Calpain 6 (CAPN6, Accession NP_055104.2) is another GAM189 target gene, herein designated TARGET GENE. CAPN6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CAPN6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CAPN6 BINDING SITE, designated SEQ ID:2208, to the nucleotide sequence of GAM189 RNA,

herein designated GAM RNA, also designated SEQ ID:246.

[28218] Another function of GAM189 is therefore inhibition of Calpain 6 (CAPN6, Accession NP_055104.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN6.

[28219] CAPRI (Accession NP_008920.3) is another GAM189 target gene, herein designated TARGET GENE. CAPRI BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CAPRI, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CAPRI BINDING SITE, designated SEQ ID:4271, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28220] Another function of GAM189 is therefore inhibition of CAPRI (Accession NP_008920.3) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPRI.

[28221] Caspase recruitment domain family, member 6 (CARD6, Accession NP_115976.2) is another GAM189 target gene, herein designated TARGET GENE. CARD6 BINDING SITE is a

target binding site found in the 3` untranslated region of mRNA encoded by CARD6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CARD6 BINDING SITE, designated SEQ ID:9036, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28222] Another function of GAM189 is therefore inhibition of Caspase recruitment domain family, member 6 (CARD6, Accession NP_115976.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARD6.

[28223] Caspase 2, apoptosis-related cysteine protease (neural precursor cell expressed, developmentally down-regulated 2) (CASP2, Accession NP_001215.1) is another GAM189 target gene, herein designated TARGET GENE. CASP2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CASP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CASP2 BINDING SITE, designated

SEQ ID:16398, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28224] Another function of GAM189 is therefore inhibition of Caspase 2, apoptosis-related cysteine protease (neural precursor cell expressed, developmentally down-regulated 2) (CASP2, Accession NP_001215.1), a gene which involves in the activation cascade of caspases responsible for apoptosis execution. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP2.

[28225] The function of CASP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM139.1.Caspase 2, apoptosis-related cysteine protease (neural precursor cell expressed, developmentally down-regulated 2) (CASP2, Accession NP_116765.1) is another GAM189 target gene, herein designated TARGET GENE. CASP2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CASP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementar-

ity of the nucleotide sequences of CASP2 BINDING SITE, designated SEQ ID:16398, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28226] Another function of GAM189 is therefore inhibition of Caspase 2, apoptosis-related cysteine protease (neural precursor cell expressed, developmentally down-regulated 2) (CASP2, Accession NP_116765.1), a gene which involves in the activation cascade of caspases responsible for apoptosis execution. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP2.

[28227] The function of CASP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM139.1.Caspase 2, apoptosis-related cysteine protease (neural precursor cell expressed, developmentally down-regulated 2) (CASP2, Accession NP_116764.1) is another GAM189 target gene, herein designated TARGET GENE. CASP2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CASP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CASP2 BINDING SITE, designated SEQ ID:16398, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28228] Another function of GAM189 is therefore inhibition of Caspase 2, apoptosis-related cysteine protease (neural precursor cell expressed, developmentally down-regulated 2) (CASP2, Accession NP_116764.1), a gene which involves in the activation cascade of caspases responsible for apoptosis execution. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP2.

[28229] The function of CASP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM139.1.Caspase 2, apoptosis-related cysteine protease (neural precursor cell expressed, developmentally down-regulated 2) (CASP2, Accession NP_116766.1) is another GAM189 target gene, herein designated TARGET GENE. CASP2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CASP2, corresponding to a target bind-

ing site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CASP2 BINDING SITE, designated SEQ ID:16398, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28230] Another function of GAM189 is therefore inhibition of Caspase 2, apoptosis-related cysteine protease (neural precursor cell expressed, developmentally down-regulated 2) (CASP2, Accession NP_116766.1), a gene which involves in the activation cascade of caspases responsible for apoptosis execution. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP2.

[28231] The function of CASP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM139.1.Caspase 8, apoptosis-related cysteine protease (CASP8, Accession NP_203520.1) is another GAM189 target gene, herein designated TARGET GENE. CASP8 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CASP8, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CASP8 BINDING SITE, designated SEQ ID:15049, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28232] Another function of GAM189 is therefore inhibition of Caspase 8, apoptosis-related cysteine protease (CASP8, Accession NP_203520.1), a gene which is an apoptosis-related caspase and an upstream component of Fas receptor and tumor necrosis factor (TNF) receptor- induced apoptosis. and therefore may be associated with Huntington- related neurodegenerative diseases. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Huntington- related neurodegenerative diseases, and of other diseases and clinical conditions associated with CASP8.

[28233] The function of CASP8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM72.1.Caspase 8, apoptosis-related cysteine protease (CASP8, Accession NP_203519.1) is another GAM189 target gene, herein designated TARGET GENE.

CASP8 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CASP8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CASP8 BINDING SITE, designated SEQ ID:15049, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28234] Another function of GAM189 is therefore inhibition of Caspase 8, apoptosis-related cysteine protease (CASP8, Accession NP_203519.1), a gene which is an apoptosis-related caspase and an upstream component of Fas receptor and tumor necrosis factor (TNF) receptor- induced apoptosis. and therefore may be associated with Huntington- related neurodegenerative diseases. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Huntington- related neurodegenerative diseases, and of other diseases and clinical conditions associated with CASP8.

[28235] The function of CASP8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to GAM72.1.Caspase 8, apoptosis-related cysteine protease (CASP8, Accession NP_001219.2) is another GAM189 target gene, herein designated TARGET GENE. CASP8 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CASP8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CASP8 BINDING SITE, designated SEQ ID:15049, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28236] Another function of GAM189 is therefore inhibition of Caspase 8, apoptosis-related cysteine protease (CASP8, Accession NP_001219.2), a gene which is an apoptosis-related caspase and an upstream component of Fas receptor and tumor necrosis factor (TNF) receptor- induced apoptosis. and therefore may be associated with Huntington- related neurodegenerative diseases. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Huntington- related neurodegenerative diseases, and of other diseases and clinical conditions associated with CASP8.

[28237] The function of CASP8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM72.1.Caspase 8, apoptosis-related cysteine protease (CASP8, Accession NP_203521.1) is another GAM189 target gene, herein designated TARGET GENE. CASP8 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CASP8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CASP8 BINDING SITE, designated SEQ ID:15049, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28238] Another function of GAM189 is therefore inhibition of Caspase 8, apoptosis-related cysteine protease (CASP8, Accession NP_203521.1), a gene which is an apoptosis-related caspase and an upstream component of Fas receptor and tumor necrosis factor (TNF) receptor- induced apoptosis. and therefore may be associated with Huntington- related neurodegenerative diseases. Accordingly, utilities of GAM189 include diagnosis, prevention and

treatment of Huntington- related neurodegenerative diseases, and of other diseases and clinical conditions associated with CASP8.

[28239] The function of CASP8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM72.1.CASPR4 (Accession NP_620481.1) is another GAM189 target gene, herein designated TARGET GENE. CASPR4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CASPR4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CASPR4 BINDING SITE, designated SEQ ID:13634, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28240] Another function of GAM189 is therefore inhibition of CASPR4 (Accession NP_620481.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASPR4.

[28241] Core-binding factor, runt domain, alpha subunit 2;

translocated to, 2 (CBFA2T2, Accession NP_787060.1) is another GAM189 target gene, herein designated TARGET GENE. CBFA2T2 BINDING SITE1 and CBFA2T2 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by CBFA2T2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CBFA2T2 BINDING SITE1 and CBFA2T2 BINDING SITE2, designated SEQ ID:8572 and SEQ ID:8572 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28242] Another function of GAM189 is therefore inhibition of Core-binding factor, runt domain, alpha subunit 2; translocated to, 2 (CBFA2T2, Accession NP_787060.1), a gene which is a putative transcription factor. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFA2T2.

[28243] The function of CBFA2T2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to GAM55.1.Core-binding factor, runt domain, alpha subunit 2; translocated to, 2 (CBFA2T2, Accession NP_787060.1) is another GAM189 target gene, herein designated TARGET GENE. CBFA2T2 BINDING SITE1 and CBFA2T2 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by CBFA2T2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CBFA2T2 BINDING SITE1 and CBFA2T2 BINDING SITE2, designated SEQ ID:8242 and SEQ ID:9543 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28244] Another function of GAM189 is therefore inhibition of Core-binding factor, runt domain, alpha subunit 2; translocated to, 2 (CBFA2T2, Accession NP_787060.1), a gene which is a putative transcription factor. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFA2T2.

[28245] The function of CBFA2T2 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to GAM55.1.Chemokine (c-c motif) ligand 22 (CCL22, Accession NP_002981.2) is another GAM189 target gene, herein designated TARGET GENE. CCL22 BINDING SITE1 and CCL22 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by CCL22, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCL22 BINDING SITE1 and CCL22 BINDING SITE2, designated SEQ ID:15049 and SEQ ID:1679 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28246] Another function of GAM189 is therefore inhibition of Chemokine (c-c motif) ligand 22 (CCL22, Accession NP_002981.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCL22.

[28247] Cyclin f (CCNF, Accession NP_001752.1) is another GAM189 target gene, herein designated TARGET GENE. CCNF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CCNF, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCNF BINDING SITE, designated SEQ ID:17624, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28248] Another function of GAM189 is therefore inhibition of Cyclin f (CCNF, Accession NP_001752.1), a gene which likely to be involved in the control of the cell cycle during s phase and g2. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCNF.

[28249] The function of CCNF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM130.1.Ccr4 carbon catabolite repression 4-like (s. cerevisiae) (CCRN4L, Accession NP_036250.2) is another GAM189 target gene, herein designated TARGET GENE. CCRN4L BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CCRN4L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCRN4L BINDING SITE, designated SEQ

ID:4698, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28250] Another function of GAM189 is therefore inhibition of Ccr4 carbon catabolite repression 4-like (s. cerevisiae) (CCRN4L, Accession NP_036250.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCRN4L.

[28251] Cd209 antigen (CD209, Accession NP_066978.1) is another GAM189 target gene, herein designated TARGET GENE. CD209 BINDING SITE1 and CD209 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by CD209, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CD209 BINDING SITE1 and CD209 BINDING SITE2, designated SEQ ID:17051 and SEQ ID:4298 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28252] Another function of GAM189 is therefore inhibition of Cd209 antigen (CD209, Accession NP_066978.1), a gene which may play an important role in the CD4- indepen-

dent association of HIV with cells. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD209.

[28253] The function of CD209 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM96.1.Cd24 antigen (small cell lung carcinoma cluster 4 antigen) (CD24, Accession NP_037362.1) is another GAM189 target gene, herein designated TARGET GENE. CD24 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CD24, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CD24 BINDING SITE, designated SEQ ID:19572, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28254] Another function of GAM189 is therefore inhibition of Cd24 antigen (small cell lung carcinoma cluster 4 antigen) (CD24, Accession NP_037362.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD24.

[28255] Cd5 antigen (p56-62) (CD5, Accession NP_055022.1) is

another GAM189 target gene, herein designated TARGET GENE. CD5 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CD5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CD5 BINDING SITE, designated SEQ ID:1049, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28256] Another function of GAM189 is therefore inhibition of Cd5 antigen (p56-62) (CD5, Accession NP_055022.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD5.

[28257] Cd84 antigen (leukocyte antigen) (CD84, Accession NP_003865.1) is another GAM189 target gene, herein designated TARGET GENE. CD84 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CD84, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CD84 BINDING SITE, designated SEQ ID:514, to the nucleotide sequence of GAM189 RNA,

herein designated GAM RNA, also designated SEQ ID:246.

[28258] Another function of GAM189 is therefore inhibition of Cd84 antigen (leukocyte antigen) (CD84, Accession NP_003865.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD84.

[28259] Cdc14 cell division cycle 14 homolog b (s. cerevisiae) (CDC14B, Accession NP_201589.1) is another GAM189 target gene, herein designated TARGET GENE. CDC14B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CDC14B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDC14B BINDING SITE, designated SEQ ID:17127, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28260] Another function of GAM189 is therefore inhibition of Cdc14 cell division cycle 14 homolog b (s. cerevisiae) (CDC14B, Accession NP_201589.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

CDC14B.

[28261] Cell division cycle 2-like 2 (CDC2L2, Accession NP_296370.1) is another GAM189 target gene, herein designated TARGET GENE. CDC2L2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CDC2L2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDC2L2 BINDING SITE, designated SEQ ID:15084, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28262] Another function of GAM189 is therefore inhibition of Cell division cycle 2-like 2 (CDC2L2, Accession NP_296370.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC2L2.

[28263] Cdc6 cell division cycle 6 homolog (s. cerevisiae) (CDC6, Accession NP_001245.1) is another GAM189 target gene, herein designated TARGET GENE. CDC6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CDC6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDC6 BINDING SITE, designated SEQ ID:9211, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28264] Another function of GAM189 is therefore inhibition of Cdc6 cell division cycle 6 homolog (s. cerevisiae) (CDC6, Accession NP_001245.1), a gene which is a component of the origin recognition complex (orc) that binds origins of replication. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC6.

[28265] The function of CDC6 has been established by previous studies. In yeasts, Cdc6 (Saccharomyces cerevisiae) and Cdc18 (Schizosaccharomyces pombe) associate with the origin recognition complex (ORC) proteins to render cells competent for DNA replication. Thus, Cdc6 has a critical regulatory role in the initiation of DNA replication in yeast. Williams et al. (1997) isolated cDNAs encoding Xenopus and human homologs of yeast CDC6. They designated the human and Xenopus proteins p62(cdc6). Independently, in a yeast 2- hybrid assay using PCNA (OMIM Ref. No. 176740) as bait, Saha et al. (1998) isolated cDNAs encod-

ing the human CDC6/Cdc18 homolog. These authors reported that the predicted 560- amino acid human protein shares approximately 33% sequence identity with the 2 yeast proteins. On Western blots of HeLa cell extracts, human CDC6/cdc18 migrates as a 66- kD protein. Although Northern blots indicated that CDC6/Cdc18 mRNA levels peak at the onset of S phase and diminish at the onset of mitosis in HeLa cells, the authors found that total CDC6/Cdc18 protein level is unchanged throughout the cell cycle. Immunofluorescent analysis of epitope- tagged protein revealed that human CDC6/Cdc18 is nuclear in G1- and cytoplasmic in S- phase cells, suggesting that DNA replication may be regulated by either the translocation of this protein between the nucleus and cytoplasm or by selective degradation of the protein in the nucleus. Immunoprecipitation studies showed that human CDC6/Cdc18 associates in vivo with cyclin A (OMIM Ref. No. 123835), CDK2 (OMIM Ref. No. 116953), and ORC1 (OMIM Ref. No. 601902). The association of cyclin- CDK2 with CDC6/Cdc18 was specifically inhibited by a factor present in mitotic cell extracts. Saha et al. (1998) suggested that if the interaction between CDC6/Cdc18 with the S phase- promoting factor cyclin- CDK2 is essential

for the initiation of DNA replication, the mitotic inhibitor of this interaction could prevent a premature interaction until the appropriate time in G1.

[28266]

[28267] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28268] Williams, R. S.; Shohet, R. V.; Stillman, B. : A human protein related to yeast Cdc6p. Proc. Nat. Acad. Sci. 94: 142-147, 1997. ; and

[28269] Saha, P.; Chen, J.; Thome, K. C.; Lawlis, S. J.; Hou, Z.- H.; Hendricks, M.; Parvin, J. D.; Dutta, A. : Human CDC6/Cdc18 associates with Orc1 and cyclin- cdk and is selectively eliminated.

[28270] Further studies establishing the function and utilities of CDC6 are found in John Hopkins OMIM database record ID 602627, and in cited publications listed in Table 5, which are hereby incorporated by reference.CDCP1 (Accession NP_073753.3) is another GAM189 target gene, herein designated TARGET GENE. CDCP1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CDCP1, corresponding to a target binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDCP1 BINDING SITE, designated SEQ ID:12091, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28271] Another function of GAM189 is therefore inhibition of CDCP1 (Accession NP_073753.3) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDCP1.

[28272] Cadherin 1, type 1, e-cadherin (epithelial) (CDH1, Accession NP_004351.1) is another GAM189 target gene, herein designated TARGET GENE. CDH1 BINDING SITE1 and CDH1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by CDH1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDH1 BINDING SITE1 and CDH1 BINDING SITE2, designated SEQ ID:12580 and SEQ ID:5514 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28273] Another function of GAM189 is therefore inhibition of Cadherin 1, type 1, e-cadherin (epithelial) (CDH1, Acces-

sion NP_004351.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH1.

[28274] Cadherin 17, li cadherin (liver-intestine) (CDH17, Accession NP_004054.2) is another GAM189 target gene, herein designated TARGET GENE. CDH17 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CDH17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDH17 BINDING SITE, designated SEQ ID:13851, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28275] Another function of GAM189 is therefore inhibition of Cadherin 17, li cadherin (liver-intestine) (CDH17, Accession NP_004054.2), a gene which may have a role in the morphological organization of liver and intestine and involved in intestinal peptide transport. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH17.

[28276] The function of CDH17 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to GAM161.1.CDK11 (Accession XP_166324.1) is another GAM189 target gene, herein designated TARGET GENE. CDK11 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CDK11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDK11 BINDING SITE, designated SEQ ID:8162, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28277] Another function of GAM189 is therefore inhibition of CDK11 (Accession XP_166324.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDK11.

[28278] CDKAL1 (Accession NP_060244.1) is another GAM189 target gene, herein designated TARGET GENE. CDKAL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CDKAL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDKAL1 BINDING SITE, designated SEQ ID:1255, to the nucleotide

sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28279] Another function of GAM189 is therefore inhibition of CDKAL1 (Accession NP_060244.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDKAL1.

[28280] Carcinoembryonic antigen-related cell adhesion molecule 8 (CEACAM8, Accession NP_001807.2) is another GAM189 target gene, herein designated TARGET GENE. CEACAM8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CEACAM8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CEACAM8 BINDING SITE, designated SEQ ID:17969, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28281] Another function of GAM189 is therefore inhibition of Carcinoembryonic antigen-related cell adhesion molecule 8 (CEACAM8, Accession NP_001807.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CEACAM8.

[28282] Cat eye syndrome chromosome region, candidate 1 (CECR1, Accession NP_059120.2) is another GAM189 target gene, herein designated TARGET GENE. CECR1 BINDING SITE1 and CECR1 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by CECR1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CECR1 BINDING SITE1 and CECR1 BINDING SITE2, designated SEQ ID:4574 and SEQ ID:9037 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28283] Another function of GAM189 is therefore inhibition of Cat eye syndrome chromosome region, candidate 1 (CECR1, Accession NP_059120.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CECR1.

[28284] Cat eye syndrome chromosome region, candidate 1 (CECR1, Accession NP_803124.1) is another GAM189 target gene, herein designated TARGET GENE. CECR1 BINDING SITE1 and CECR1 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts

of mRNA encoded by CECR1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CECR1 BINDING SITE1 and CECR1 BINDING SITE2, designated SEQ ID:9037 and SEQ ID:4574 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28285] Another function of GAM189 is therefore inhibition of Cat eye syndrome chromosome region, candidate 1 (CECR1, Accession NP_803124.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CECR1.

[28286] Centromere protein h (CENPH, Accession NP_075060.1) is another GAM189 target gene, herein designated TARGET GENE. CENPH BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CENPH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CENPH BINDING SITE, designated SEQ ID:19549, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ

ID:246.

[28287] Another function of GAM189 is therefore inhibition of Centromere protein h (CENPH, Accession NP_075060.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENPH.

[28288] Centromere protein j (CENPJ, Accession NP_060921.2) is another GAM189 target gene, herein designated TARGET GENE. CENPJ BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CENPJ, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CENPJ BINDING SITE, designated SEQ ID:13565, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28289] Another function of GAM189 is therefore inhibition of Centromere protein j (CENPJ, Accession NP_060921.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENPJ.

[28290] CGI-150 (Accession NP_057164.1) is another GAM189 target gene, herein designated TARGET GENE. CGI-150

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CGI-150, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CGI-150 BINDING SITE, designated SEQ ID:2191, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28291] Another function of GAM189 is therefore inhibition of CGI-150 (Accession NP_057164.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGI-150.

[28292] CGI-18 (Accession NP_057031.1) is another GAM189 target gene, herein designated TARGET GENE. CGI-18 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CGI-18, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CGI-18 BINDING SITE, designated SEQ ID:18313, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28293] Another function of GAM189 is therefore inhibition of CGI-18 (Accession NP_057031.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGI-18.

[28294] CGI-43 (Accession NP_056437.1) is another GAM189 target gene, herein designated TARGET GENE. CGI-43 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CGI-43, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CGI-43 BINDING SITE, designated SEQ ID:14860, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28295] Another function of GAM189 is therefore inhibition of CGI-43 (Accession NP_056437.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGI-43.

[28296] Chromosome condensation 1-like (CHC1L, Accession NP_001259.1) is another GAM189 target gene, herein designated TARGET GENE. CHC1L BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CHC1L, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHC1L BINDING SITE, designated SEQ ID:15582, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28297] Another function of GAM189 is therefore inhibition of Chromosome condensation 1-like (CHC1L, Accession NP_001259.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHC1L.

[28298] Chromatin accessibility complex 1 (CHRAC1, Accession NP_059140.1) is another GAM189 target gene, herein designated TARGET GENE. CHRAC1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CHRAC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHRAC1 BINDING SITE, designated SEQ ID:9475, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28299] Another function of GAM189 is therefore inhibition of

Chromatin accessibility complex 1 (CHRAC1, Accession NP_059140.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHRAC1.

[28300] Carbohydrate (chondroitin) synthase 1 (CHSY1, Accession NP_055733.2) is another GAM189 target gene, herein designated TARGET GENE. CHSY1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CHSY1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHSY1 BINDING SITE, designated SEQ ID:11924, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28301] Another function of GAM189 is therefore inhibition of Carbohydrate (chondroitin) synthase 1 (CHSY1, Accession NP_055733.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHSY1.

[28302] Cold autoinflammatory syndrome 1 (CIAS1, Accession NP_004886.2) is another GAM189 target gene, herein designated TARGET GENE. CIAS1 BINDING SITE is a target

binding site found in the 5` untranslated region of mRNA encoded by CIAS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CIAS1 BINDING SITE, designated SEQ ID:13461, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28303] Another function of GAM189 is therefore inhibition of Cold autoinflammatory syndrome 1 (CIAS1, Accession NP_004886.2), a gene which may mediate protein- protein interactions; contains a leucine rich repeat and therefore may be associated with Familial cold autoinflammatory syndrome, muckle- wells syndrome. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Familial cold autoinflammatory syndrome, muckle- wells syndrome, and of other diseases and clinical conditions associated with CIAS1.

[28304] The function of CIAS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM90.1.CIP29 (Accession NP_115740.3) is another GAM189 target gene, herein designated TARGET GENE.

CIP29 BINDING SITE1 and CIP29 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by CIP29, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CIP29 BINDING SITE1 and CIP29 BINDING SITE2, designated SEQ ID:3509 and SEQ ID:20120 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28305] Another function of GAM189 is therefore inhibition of CIP29 (Accession NP_115740.3) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CIP29.

[28306] Claudin 19 (CLDN19, Accession NP_683763.1) is another GAM189 target gene, herein designated TARGET GENE. CLDN19 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CLDN19, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLDN19 BINDING SITE, designated SEQ ID:5914, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28307] Another function of GAM189 is therefore inhibition of Claudin 19 (CLDN19, Accession NP_683763.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLDN19.

[28308] C-type (calcium dependent, carbohydrate-recognition domain) lectin, superfamily member 12 (CLECSF12, Accession NP_072092.2) is another GAM189 target gene, herein designated TARGET GENE. CLECSF12 BINDING SITE1 and CLECSF12 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by CLECSF12, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLECSF12 BINDING SITE1 and CLECSF12 BINDING SITE2, designated SEQ ID:16192 and SEQ ID:15296 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28309] Another function of GAM189 is therefore inhibition of C-type (calcium dependent, carbohydrate-recognition domain) lectin, superfamily member 12 (CLECSF12, Accession NP_072092.2), a gene which is a pattern- recognition receptor . Accordingly, utilities of GAM189 include diag-

nosis, prevention and treatment of diseases and clinical conditions associated with CLECSF12.

[28310] The function of CLECSF12 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.Chloride intracellular channel 5 (CLIC5, Accession NP_058625.1) is another GAM189 target gene, herein designated TARGET GENE. CLIC5 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CLIC5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLIC5 BINDING SITE, designated SEQ ID:19116, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28311] Another function of GAM189 is therefore inhibition of Chloride intracellular channel 5 (CLIC5, Accession NP_058625.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLIC5.

[28312] Ceroid-lipofuscinosis, neuronal 8 (epilepsy, progressive with mental retardation) (CLN8, Accession NP_061764.2)

is another GAM189 target gene, herein designated TARGET GENE. CLN8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CLN8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLN8 BINDING SITE, designated SEQ ID:515, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28313] Another function of GAM189 is therefore inhibition of Ceroid-lipofuscinosis, neuronal 8 (epilepsy, progressive with mental retardation) (CLN8, Accession NP_061764.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLN8.

[28314] Chloride channel, nucleotide-sensitive, 1a (CLNS1A, Accession NP_001284.1) is another GAM189 target gene, herein designated TARGET GENE. CLNS1A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CLNS1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLNS1A BINDING

SITE, designated SEQ ID:18823, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28315] Another function of GAM189 is therefore inhibition of Chloride channel, nucleotide-sensitive, 1a (CLNS1A, Accession NP_001284.1), a gene which may participate in cellular volume control . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLNS1A.

[28316] The function of CLNS1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM96.1.Cell matrix adhesion regulator (CMAR, Accession NP_005191.2) is another GAM189 target gene, herein designated TARGET GENE. CMAR BINDING SITE1 and CMAR BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by CMAR, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CMAR BINDING SITE1 and CMAR BINDING SITE2, designated SEQ ID:5053 and SEQ ID:18767 respectively, to the nucleotide sequence of GAM189 RNA, herein designated

GAM RNA, also designated SEQ ID:246.

[28317] Another function of GAM189 is therefore inhibition of Cell matrix adhesion regulator (CMAR, Accession NP_005191.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CMAR.

[28318] Calponin 2 (CNN2, Accession NP_004359.1) is another GAM189 target gene, herein designated TARGET GENE. CNN2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CNN2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CNN2 BINDING SITE, designated SEQ ID:9959, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28319] Another function of GAM189 is therefore inhibition of Calponin 2 (CNN2, Accession NP_004359.1), a gene which may be involved in the structural organization and/or anchorage of actin filaments. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNN2.

[28320] The function of CNN2 and its association with various dis-

eases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM136.1.2',3'-cyclic nucleotide 3' phosphodiesterase (CNP, Accession NP_149124.1) is another GAM189 target gene, herein designated TARGET GENE. CNP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CNP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CNP BINDING SITE, designated SEQ ID:606, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28321] Another function of GAM189 is therefore inhibition of 2',3'-cyclic nucleotide 3' phosphodiesterase (CNP, Accession NP_149124.1), a gene which can link tubulin to membranes and may regulate cytoplasmic microtubule distribution. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNP.

[28322] The function of CNP has been established by previous studies. Cyclic nucleotide phosphodiesterase is a useful marker of myelin. CNPase is a membrane- bound enzyme

found at high concentrations in central nervous system myelin and in the outer segments of photoreceptors in the retina (Vogel and Thompson, 1988). Two proteins with CNP activity are known to exist in brain and lymphoid tissues. They appear to be the products of distinct but related mRNA species. Kurihara et al. (1990) showed that the 2 gene products can arise by translation of 2 mRNAs alternatively spliced from a single transcript. In bovine and human brain, there appears to be a single species of mRNA (Vogel and Thompson, 1988), and the bovine brain and retinal forms of the enzyme appear to be identical in sequence Bifulco et al. (2002) demonstrated that CNP is firmly associated with tubulin (OMIM Ref. No. 602529) from brain tissue and thyroid cells. They showed that CNP acts as a microtubule- associated protein in promoting microtubule assembly. This activity was found to reside in the C terminus of the enzyme. The authors concluded that CNP is a membrane- bound microtubule- associated protein that can link tubulin to membranes and may regulate cytoplasmic microtubule distribution

[28323]

[28324] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[28325] Vogel, U. S.; Thompson, R. J. : Molecular structure, localization, and possible functions of the myelin- associated enzyme 2- prime,3- prime- cyclic nucleotide 3- prime- phosphodiesterase. J. Neurochem. 50: 1667- 1677, 1988. ; and

[28326] Bifulco, M.; Laezza, C.; Stingo, S.; Wolff, J. : 2- prime,3- prime- cyclic nucleotide 3- prime- phosphodiesterase: a membrane- bound, microtubule- associated protein and membrane anchor for tub.

[28327] Further studies establishing the function and utilities of CNP are found in John Hopkins OMIM database record ID 123830, and in cited publications listed in Table 5, which are hereby incorporated by reference.Collectin sub-family member 12 (COLEC12, Accession NP_110408.2) is another GAM189 target gene, herein designated TARGET GENE. COLEC12 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by COLEC12, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COLEC12 BINDING SITE, designated SEQ ID:11525, to the nucleotide se-

quence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28328] Another function of GAM189 is therefore inhibition of Collectin sub-family member 12 (COLEC12, Accession NP_110408.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COLEC12.

[28329] Coronin, actin binding protein, 1c (CORO1C, Accession NP_055140.1) is another GAM189 target gene, herein designated TARGET GENE. CORO1C BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CORO1C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CORO1C BINDING SITE, designated SEQ ID:13595, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28330] Another function of GAM189 is therefore inhibition of Coronin, actin binding protein, 1c (CORO1C, Accession NP_055140.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CORO1C.

[28331] Cox15 homolog, cytochrome c oxidase assembly protein (yeast) (COX15, Accession NP_510870.1) is another GAM189 target gene, herein designated TARGET GENE. COX15 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by COX15, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COX15 BINDING SITE, designated SEQ ID:7552, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28332] Another function of GAM189 is therefore inhibition of Cox15 homolog, cytochrome c oxidase assembly protein (yeast) (COX15, Accession NP_510870.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COX15.

[28333] Carboxypeptidase a4 (CPA4, Accession NP_057436.1) is another GAM189 target gene, herein designated TARGET GENE. CPA4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CPA4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4

illustrates the complementarity of the nucleotide sequences of CPA4 BINDING SITE, designated SEQ ID:8942, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28334] Another function of GAM189 is therefore inhibition of Carboxypeptidase a4 (CPA4, Accession NP_057436.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPA4.

[28335] CPR8 (Accession NP_065790.1) is another GAM189 target gene, herein designated TARGET GENE. CPR8 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CPR8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CPR8 BINDING SITE, designated SEQ ID:13999, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28336] Another function of GAM189 is therefore inhibition of CPR8 (Accession NP_065790.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPR8.

[28337] Carbamoyl-phosphate synthetase 1, mitochondrial (CPS1, Accession NP_001866.2) is another GAM189 target gene, herein designated TARGET GENE. CPS1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CPS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CPS1 BINDING SITE, designated SEQ ID:14493, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28338] Another function of GAM189 is therefore inhibition of Carbamoyl-phosphate synthetase 1, mitochondrial (CPS1, Accession NP_001866.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPS1.

[28339] Cleavage and polyadenylation specific factor 2, 100kda (CPSF2, Accession XP_029311.2) is another GAM189 target gene, herein designated TARGET GENE. CPSF2 BINDING SITE1 and CPSF2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by CPSF2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of

Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CPSF2 BINDING SITE1 and CPSF2 BINDING SITE2, designated SEQ ID:1877 and SEQ ID:591 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28340] Another function of GAM189 is therefore inhibition of Cleavage and polyadenylation specific factor 2, 100kda (CPSF2, Accession XP_029311.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPSF2.

[28341] Complement component (3b/4b) receptor 1, including knops blood group system (CR1, Accession NP_000642.2) is another GAM189 target gene, herein designated TARGET GENE. CR1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CR1 BINDING SITE, designated SEQ ID:17292, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28342] Another function of GAM189 is therefore inhibition of

Complement component (3b/4b) receptor 1, including knops blood group system (CR1, Accession NP_000642.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CR1.

[28343] Complement component (3b/4b) receptor 1, including knops blood group system (CR1, Accession NP_000564.1) is another GAM189 target gene, herein designated TARGET GENE. CR1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CR1 BINDING SITE, designated SEQ ID:17292, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28344] Another function of GAM189 is therefore inhibition of Complement component (3b/4b) receptor 1, including knops blood group system (CR1, Accession NP_000564.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CR1.

[28345] Cytokine receptor-like factor 3 (CRLF3, Accession NP_057070.2) is another GAM189 target gene, herein designated TARGET GENE. CRLF3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CRLF3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CRLF3 BINDING SITE, designated SEQ ID:7105, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28346] Another function of GAM189 is therefore inhibition of Cytokine receptor-like factor 3 (CRLF3, Accession NP_057070.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRLF3.

[28347] Cofactor required for sp1 transcriptional activation, subunit 6, 77kda (CRSP6, Accession NP_004259.3) is another GAM189 target gene, herein designated TARGET GENE. CRSP6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CRSP6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of CRSP6 BINDING SITE, designated SEQ ID:7661, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28348] Another function of GAM189 is therefore inhibition of Co-factor required for sp1 transcriptional activation, subunit 6, 77kda (CRSP6, Accession NP_004259.3), a gene which is required for Sp1 mediated transcriptional activation with TAF(II)s. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRSP6.

[28349] The function of CRSP6 has been established by previous studies. Using a HeLa cell line, Ito et al. (1999) cloned TRAP80, the gene encoding the 80- kD subunit of the TRAP complex. (For background information on thyroid hormone receptor- associated proteins (TRAPs), see 300182). The TRAP80 cDNA encodes a 717- amino acid protein that has no obvious motifs other than a short leucine zipper in the middle of the sequence. The TRAP80 cDNA appears to be equivalent to the p78 component of the mouse Mediator (Jiang et al., 1998). Northern blot analysis of multiple human tissues showed that the TRAP80 gene is ubiquitously expressed as an approximately 3.0- kb transcript Gene transcription requires fac-

tors that recognize transcriptional enhancer sites in DNA. These factors work with coactivators to direct transcriptional initiation by the RNA polymerase II apparatus (see OMIM Ref. No. POLR2A, 180660). Transcriptional activation by enhancer- binding factors such as SP1 (OMIM Ref. No. 189906) requires interaction with the TFIID complex (see OMIM Ref. No. TAF2A, 313650). To identify other potential SP1 cofactors, Ryu et al. (1999) developed an in vitro transcription assay consisting of TFIIA (GTF2A1; 600520), RNA polII, and the basal transcription factors GTF2B (OMIM Ref. No. 189963), GTF2E (OMIM Ref. No. 189962), GTF2F (OMIM Ref. No. 189968), and GTF2H (OMIM Ref. No. 189972), supplemented with TFIID or TBP (OMIM Ref. No. 600075). By sequential chromatography, they excluded PC4 (OMIM Ref. No. 600503) as an SP1 cofactor and identified a multisubunit cofactor, CRSP (cofactor required for SP1 activation), which, along with TFIID, is required for efficient activation by SP1. CRSP behaves as a single complex of approximately 700 kD. Ryu et al. (1999) tentatively identified 9 polypeptides as CRSP subunits (see OMIM Ref. No. also PPARBP, 604311). Using microsequence peptide analysis, they cloned a CRSP cDNA encoding a 77- kD protein, CRSP6, which they termed

CRSP77

[28350]

[28351] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28352] Ito, M.; Yuan, C.- X.; Malik, S.; Gu, W.; Fondell, J. D.; Yamamura, S.; Fu, Z.- Y.; Zhang, X.; Qin, J.; Roeder, R. G. : Identity between TRAP and SMCC complexes indicates novel pathways for the function of nuclear receptors and diverse mammalian activators. Molec. Cell 3: 361- 370, 1999. ; and

[28353] Ryu, S.; Zhou, S.; Ladurner, A. G.; Tjian, R. : The transcriptional cofactor complex CRSP is required for activity of the enhancer- binding protein Sp1. Nature 397: 446- 450, 1999.

[28354] Further studies establishing the function and utilities of CRSP6 are found in John Hopkins OMIM database record ID 603810, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cartilage associated protein (CRTAP, Accession NP_006362.1) is another GAM189 target gene, herein designated TARGET GENE. CRTAP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CRTAP,

corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CRTAP BINDING SITE, designated SEQ ID:7107, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28355] Another function of GAM189 is therefore inhibition of Cartilage associated protein (CRTAP, Accession NP_006362.1), a gene which is a novel developmentally regulated chick embryo protein. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRTAP.

[28356] The function of CRTAP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM136.1.CSE-C (Accession NP_061851.1) is another GAM189 target gene, herein designated TARGET GENE. CSE-C BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CSE-C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CSE-C BINDING SITE, designated

SEQ ID:2336, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28357] Another function of GAM189 is therefore inhibition of CSE-C (Accession NP_061851.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSE-C.

[28358] Cse1 chromosome segregation 1-like (yeast) (CSE1L, Accession NP_803185.1) is another GAM189 target gene, herein designated TARGET GENE. CSE1L BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CSE1L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CSE1L BINDING SITE, designated SEQ ID:6312, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28359] Another function of GAM189 is therefore inhibition of Cse1 chromosome segregation 1-like (yeast) (CSE1L, Accession NP_803185.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSE1L.

[28360] Casein kinase 2, alpha prime polypeptide (CSNK2A2, Ac-

cession NP_001887.1) is another GAM189 target gene, herein designated TARGET GENE. CSNK2A2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CSNK2A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CSNK2A2 BINDING SITE, designated SEQ ID:15382, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28361] Another function of GAM189 is therefore inhibition of Casein kinase 2, alpha prime polypeptide (CSNK2A2, Accession NP_001887.1), a gene which catalyzes the phosphorylation of serine or threonine residues in proteins. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSNK2A2.

[28362] The function of CSNK2A2 has been established by previous studies. Phosphorylation of the human p53 protein (OMIM Ref. No. 191170) at ser392 is responsive to ultraviolet (UV) but not gamma irradiation. Keller et al. (2001) identified and purified a mammalian UV- activated protein kinase complex that phosphorylates ser392 in vitro. This

kinase complex contains CK2 and the chromatin transcriptional elongation factor FACT, a heterodimer of SPT16 (OMIM Ref. No. 605012) and SSRP1 (OMIM Ref. No. 604328). In vitro studies showed that FACT alters the specificity of CK2 in the complex such that it selectively phosphorylates p53 over other substrates, including casein. In addition, phosphorylation by the kinase complex was found to enhance p53 activity. These results provided a potential mechanism for p53 activation by UV irradiation Doray et al. (2002) demonstrated that the Golgi- localized, gamma- ear- containing adenosine diphosphate ribosylation factor- binding proteins (GGA1, 606004 and GGA3, 606006) and the coat protein adaptor protein- 1 (AP- 1) complex (see OMIM Ref. No. AP1G2, 603534) colocalize in clathrin- coated buds of the trans- Golgi networks of mouse L cells and human HeLa cells. Binding studies revealed a direct interaction between the hinge domains of the GGAs and the gamma- ear domain of AP-1. Further, AP- 1 contained bound casein kinase- 2 that phosphorylated GGA1 and GGA3, thereby causing autoinhibition. Doray et al. (2002) demonstrated that this autoinhibition could induce the directed transfer of mannose 6- phosphate receptors (see OMIM Ref. No. 154540) from

the GGAs to AP- 1. Mannose 6- phosphate receptors that were defective in binding to GGAs were poorly incorporated into adaptor protein complex containing clathrin coated vesicles. Thus, Doray et al. (2002) concluded that GGAs and the AP- 1 complex interact to package mannose 6- phosphate receptors into AP- 1- containing coated vesicles

[28363] Animal model experiments lend further support to the function of CSNK2A2. To determine the functional and developmental role of protein kinase casein kinase II, Xu et al. (1999) used homologous recombination to disrupt the gene encoding Csnk2a2 in transgenic mice. They found that Csnk2a2 is preferentially expressed in late stages of spermatogenesis, and male mice in which Csnk2a2 has been disrupted are infertile, with oligospermia and globozoospermia ('round- headed spermatozoa'). This was the first demonstration of the unique role for a Ck2 isoform in development. The primary spermatogenic defect in the Csnk2a2 - /- testis is a specific abnormality of anterior head shaping of elongating spermatids; this is the first defined gene that regulates sperm head morphogenesis. As the germ cells differentiate, they are capable of undergoing chromatin condensation, although many

abnormal cells are deleted through apoptosis or Sertoli cell phagocytosis. The few that survived to populate the epididymis exhibited head abnormalities similar to those described in human globozoospermia; thus, Csnk2a2 may be a candidate gene for inherited abnormalities of sperm morphogenesis

[28364] It is appreciated that the abovementioned animal model for CSNK2A2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[28365] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28366] Doray, B.; Ghosh, P.; Griffith, J.; Geuze, H. J.; Kornfeld, S. : Cooperation of GGAs and AP- 1 in packaging MPRs at the trans- Golgi network. Science 297: 1700- 1703, 2002. ; and

[28367] Xu, X.; Toselli, P. A.; Russell, L. D.; Seldin, D. C. : Globo-zoospermia in mice lacking the casein kinase II alpha-prime catalytic subunit. Nature Genet. 23: 118- 121, 1999.

[28368] Further studies establishing the function and utilities of CSNK2A2 are found in John Hopkins OMIM database

record ID 115442, and in cited publications listed in Table 5, which are hereby incorporated by reference.CTEN (Accession NP_116254.3) is another GAM189 target gene, herein designated TARGET GENE. CTEN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CTEN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CTEN BINDING SITE, designated SEQ ID:14746, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28369] Another function of GAM189 is therefore inhibition of CTEN (Accession NP_116254.3) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTEN.

[28370] Cardiotrophin 1 (CTF1, Accession NP_001321.1) is another GAM189 target gene, herein designated TARGET GENE. CTF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CTF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide se-

quences of CTF1 BINDING SITE, designated SEQ ID:13287, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28371] Another function of GAM189 is therefore inhibition of Cardiotrophin 1 (CTF1, Accession NP_001321.1), a gene which may play a role in cardiac hypertrophy. and therefore may be associated with Cardiac hypertrophy. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Cardiac hypertrophy, and of other diseases and clinical conditions associated with CTF1.

[28372] The function of CTF1 has been established by previous studies. Heart failure is a leading cause of mortality worldwide. A hallmark of the disease is dilated cardiac hypertrophy, which is accompanied by a reactivation of genes expressed in fetal heart development. Reasoning that fetal or embryonic growth factors may mediate the onset of cardiac hypertrophy, Pennica et al. (1995) coupled expression cloning with an embryonic stem cell-based model of cardiogenesis to isolate a 21.5- kD protein, cardiotrophin 1, that potently induces cardiac myocyte hypertrophy in vitro. Amino acid similarity data indicated that CT1 is a member of the family of cytokines that includes leukemia inhibitory factor (LIF; 159540), cil-

iary neurotrophic factor (CNTF; 118945), oncostatin M (OSM; 165095), interleukin 6 (IL6; 147620), and interleukin 11 (IL11; 147681). Several members of this family that are known to signal through the transmembrane protein gp130 (OMIM Ref. No. 162820) stimulate cardiac myocyte hypertrophy, like cardiotrophin 1, suggesting that the gp130 signaling pathway may play a role in cardiac hypertrophy. The 1.4- kb CT1 mRNA is present in the heart and several other mouse tissues Amyotrophic lateral sclerosis (ALS; 105400) is mainly a sporadic neurodegenerative disorder characterized by loss of cortical and spinal motoneurons. Some familial ALS (FALS) cases have been linked to dominant mutations in the gene encoding Cu/Zn superoxide dismutase (SOD1; 147450). Transgenic mice overexpressing a mutated form of human SOD1 with a gly93- to- ala substitution (147450.0008) develop progressive muscle wasting and paralysis as a result of spinal motoneuron loss and die at 5 to 6 months. Bordet et al. (2001) investigated the effects of neurotrophic factor gene delivery in this FALS model. Intramuscular injection of an adenoviral vector encoding CTF1 in SOD1(G93A) newborn mice delayed the onset of motor impairment as assessed in the rotarod test. By CTF1 treatment, axonal degenera-

tion was slowed, skeletal muscle atrophy was largely reduced, and the time- course of motor impairment was significantly decreased

[28373]

[28374] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28375] Pennica, D.; King, K. L.; Shaw, K. J.; Luis, E.; Rullamas, J.; Luoh, S.- M.; Darbonne, W. C.; Knutzon, D. S.; Yen, R.; Chien, K. R.; Baker, J. B.; Wood, W. I. : Expression cloning of cardiotrophin 1, a cytokine that induces cardiac myocyte hypertrophy. Proc. Nat. Acad. Sci. 92: 1142- 1146, 1995. ; and

[28376] Bordet, T.; Lesbordes, J.- C.; Rouhani, S.; Castelnau-Ptakhine, L.; Schmalbruch, H.; Haase, G.; Kahn, A. : Protective effects of cardiotrophin- 1 adenoviral gene transfer on neuromuscular.

[28377] Further studies establishing the function and utilities of CTF1 are found in John Hopkins OMIM database record ID 600435, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cathepsin s (CTSS, Accession NP_004070.3) is another GAM189 target gene, herein designated TARGET GENE. CTSS BINDING SITE is a

target binding site found in the 3` untranslated region of mRNA encoded by CTSS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CTSS BINDING SITE, designated SEQ ID:4517, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28378] Another function of GAM189 is therefore inhibition of Cathepsin s (CTSS, Accession NP_004070.3), a gene which is a lysosomal cysteine (thiol) protease that cleaves elastin. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTSS.

[28379] The function of CTSS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM72.1.Chemokine (c-x-c motif) ligand 16 (CXCL16, Accession NP_071342.1) is another GAM189 target gene, herein designated TARGET GENE. CXCL16 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CXCL16, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CXCL16 BINDING SITE, designated SEQ ID:17688, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28380] Another function of GAM189 is therefore inhibition of Chemokine (c-x-c motif) ligand 16 (CXCL16, Accession NP_071342.1), a gene which induces calcium mobilization. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXCL16.

[28381] The function of CXCL16 has been established by previous studies. Using a 2- step EST database search in which putative transcripts were scanned for the occurrence of functional patterns, Matloubian et al. (2000) identified a cDNA encoding a CXC chemokine that they termed CXCL16. The predicted 273- amino acid CXCL16 protein, which is 49% identical to the 246- amino acid mouse sequence, contains a non- glu/leu/arg (ELR) motif- containing CXC chemokine domain, a mucin- like spacer region, a transmembrane domain, and a cytoplasmic tail with a potential tyrosine phosphorylation and SH2 protein- binding site. CXCL16 was the first transmembrane CXC

chemokine identified; CX3CL1 (SCYD1; 601880), which also has a mucin- like spacer region, was the only other known transmembrane chemokine. Northern blot analysis of mouse and human tissues detected a 2.2- kb CXCL16 transcript in spleen, lymph nodes, Peyer patches, lung, kidney, small intestine, and thymus, with weak expression in heart and liver and no expression in brain and bone marrow. Flow cytometry and Western blot analysis demonstrated expression of an approximately 60- kD glycosylated cell- surface protein as well as a cell supernatant 35- kD soluble protein. Flow cytometry of cells from mouse tissues indicated that CXCL16 is found on CD11C (ITGAX; 151510)- positive splenic and lymph node dendritic cells; this expression was increased after injection with lipopolysaccharide. Immunohistochemical analysis showed that CXCL16 is expressed in T- cell areas of the splenic white pulp, lymph nodes, the thymus medulla, and, interestingly, in the splenic red pulp. No staining was observed in B- cell areas. After injection of inflammatory mediators, expression was enhanced in T- cell zones and, more prominently, in splenic red pulp. Chemotaxis assays found that CXCL16 induced a strong chemotactic response in activated CD8 T cells. In addition, CXCL16 in-

duced calcium mobilization. Expression cloning of mouse Cxcl16 identified a protein with 71% amino acid identity to human BONZO (OMIM Ref. No. 605163), which Matloubian et al. (2000) renamed CXCR6. Human and mouse cells expressing CXCR6 showed a strong chemotactic response to CXCL16 but not to other chemokines. The authors concluded that CXCL16 and CXCR6 probably function in interactions between dendritic cells and T cells and in regulating T- cell migration in the splenic red pulp.

Macrophages endocytose oxidized low density lipoprotein (OxLDL) by a receptor- mediated mechanism. By expression cloning from a phorbol ester- stimulated THP- 1 cell library, Shimaoka et al. (2000) isolated a cDNA encoding SRPSOX (scavenger receptor that binds phophatidylserine and oxidized lipoprotein). The deduced 254- amino acid type I transmembrane protein is identical to the CXCL16 protein reported by Matloubian et al. (2000) except that SRPSOX differs by 2 residues and lacks the N- terminal 19 amino acids. Cells expressing SRPSOX bound to phophatidylserine- coated plates; this binding could be inhibited by OxLDL. Scatchard analysis confirmed that SRPSOX is a specific receptor for OxLDL but not LDL or acetyl- LDL. Fluorescence microscopy demonstrated

OxLDL uptake in SRPSOX- expressing cells. Immunoblot analysis showed that SRPSOX is expressed as a 30- kD protein in human and mouse macrophages. Northern blot analysis revealed differentiation- inducible expression of 1.8- and 2.5- kb transcripts in macrophages.

[28382]

[28383] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28384] Matloubian, M.; David, A.; Engel, S.; Ryan, J. E.; Cyster, J. G. : A transmembrane CXC chemokine is a ligand for HIV-coreceptor Bonzo. Nature Immun. 1: 298- 304, 2000. ; and

[28385] Shimaoka, T.; Kume, N.; Minami, M.; Hayashida, K.; Kataoka, H.; Kita, T.; Yonehara, S. : Molecular cloning of a novel scavenger receptor for oxidized low density lipoprotein, SR- PSOX.

[28386] Further studies establishing the function and utilities of CXCL16 are found in John Hopkins OMIM database record ID 605398, and in cited publications listed in Table 5, which are hereby incorporated by reference.CYCS (Accession NP_061820.1) is another GAM189 target gene, herein designated TARGET GENE. CYCS BINDING SITE1

through CYCS BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by CYCS, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYCS BINDING SITE1 through CYCS BINDING SITE3, designated SEQ ID:9339, SEQ ID:18991 and SEQ ID:18868 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28387] Another function of GAM189 is therefore inhibition of CYCS (Accession NP_061820.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYCS.

[28388] Cylicin, basic protein of sperm head cytoskeleton 2 (CYLC2, Accession NP_001331.1) is another GAM189 target gene, herein designated TARGET GENE. CYLC2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CYLC2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYLC2 BINDING SITE, designated SEQ ID:15540, to the nucleotide

sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28389] Another function of GAM189 is therefore inhibition of Cylicin, basic protein of sperm head cytoskeleton 2 (CYLC2, Accession NP_001331.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYLC2.

[28390] Cytochrome p450, subfamily i (aromatic compound-inducible), polypeptide 2 (CYP1A2, Accession NP_000752.1) is another GAM189 target gene, herein designated TARGET GENE. CYP1A2 BINDING SITE1 through CYP1A2 BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by CYP1A2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYP1A2 BINDING SITE1 through CYP1A2 BINDING SITE3, designated SEQ ID:6637, SEQ ID:13576 and SEQ ID:18279 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28391] Another function of GAM189 is therefore inhibition of Cytochrome p450, subfamily i (aromatic compound-inducible), polypeptide 2 (CYP1A2, Accession

NP_000752.1), a gene which intervenes in an NADPH- dependent electron transport pathway. and therefore may be associated with Porphyria cutanea tarda. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Porphyria cutanea tarda, and of other diseases and clinical conditions associated with CYP1A2.

[28392] The function of CYP1A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Cytochrome p450, subfamily iib (phenobarbital-inducible), polypeptide 6 (CYP2B6, Accession NP_000758.1) is another GAM189 target gene, herein designated TARGET GENE. CYP2B6 BINDING SITE1 and CYP2B6 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by CYP2B6, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYP2B6 BINDING SITE1 and CYP2B6 BINDING SITE2, designated SEQ ID:2194 and SEQ ID:10618 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28393] Another function of GAM189 is therefore inhibition of Cy-

tochrome p450, subfamily iib (phenobarbital-inducible), polypeptide 6 (CYP2B6, Accession NP_000758.1), a gene which oxidizes a variety of structurally unrelated compounds, including steroids, fatty acids, and xenobiotics. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP2B6.

[28394] The function of CYP2B6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Cytochrome p450, subfamily ivf, polypeptide 3 (leukotriene b4 omega hydroxylase) (CYP4F3, Accession NP_000887.1) is another GAM189 target gene, herein designated TARGET GENE. CYP4F3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CYP4F3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYP4F3 BINDING SITE, designated SEQ ID:9158, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28395] Another function of GAM189 is therefore inhibition of Cy-

tochrome p450, subfamily ivf, polypeptide 3 (leukotriene b4 omega hydroxylase) (CYP4F3, Accession NP_000887.1), a gene which converts leukotriene B4 into the less active 20- hydroxy- leukotriene B4. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP4F3.

[28396] The function of CYP4F3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM67.1.CYP51A1 (Accession NP_000777.1) is another GAM189 target gene, herein designated TARGET GENE. CYP51A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CYP51A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYP51A1 BINDING SITE, designated SEQ ID:2152, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28397] Another function of GAM189 is therefore inhibition of CYP51A1 (Accession NP_000777.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with CYP51A1.

[28398] Cytochrome p450, subfamily viiib (sterol 12-alpha-hydroxylase), polypeptide 1 (CYP8B1, Accession NP_004382.1) is another GAM189 target gene, herein designated TARGET GENE. CYP8B1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CYP8B1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYP8B1 BINDING SITE, designated SEQ ID:5978, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28399] Another function of GAM189 is therefore inhibition of Cytochrome p450, subfamily viiib (sterol 12-alpha-hydroxylase), polypeptide 1 (CYP8B1, Accession NP_004382.1), a gene which functions in bile acid biosynthesis. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP8B1.

[28400] The function of CYP8B1 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to GAM47.1.Debranching enzyme homolog 1 (s. cerevisiae) (DBR1, Accession NP_057300.1) is another GAM189 target gene, herein designated TARGET GENE. DBR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DBR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DBR1 BINDING SITE, designated SEQ ID:7961, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28401] Another function of GAM189 is therefore inhibition of Debranching enzyme homolog 1 (s. cerevisiae) (DBR1, Accession NP_057300.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DBR1.

[28402] Doublecortex; lissencephaly, x-linked (doublecortin) (DCX, Accession NP_835365.1) is another GAM189 target gene, herein designated TARGET GENE. DCX BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DCX, corresponding to a target binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DCX BINDING SITE, designated SEQ ID:16590, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28403] Another function of GAM189 is therefore inhibition of Doublecortex; lissencephaly, x-linked (doublecortin) (DCX, Accession NP_835365.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCX.

[28404] Doublecortex; lissencephaly, x-linked (doublecortin) (DCX, Accession NP_835364.1) is another GAM189 target gene, herein designated TARGET GENE. DCX BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DCX, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DCX BINDING SITE, designated SEQ ID:16590, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28405] Another function of GAM189 is therefore inhibition of Doublecortex; lissencephaly, x-linked (doublecortin)

(DCX, Accession NP_835364.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCX.

[28406] Doublecortex; lissencephaly, x-linked (doublecortin) (DCX, Accession NP_000546.2) is another GAM189 target gene, herein designated TARGET GENE. DCX BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DCX, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DCX BINDING SITE, designated SEQ ID:16590, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28407] Another function of GAM189 is therefore inhibition of Doublecortex; lissencephaly, x-linked (doublecortin) (DCX, Accession NP_000546.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCX.

[28408] Doublecortex; lissencephaly, x-linked (doublecortin) (DCX, Accession NP_835366.1) is another GAM189 target gene, herein designated TARGET GENE. DCX BINDING SITE is a target binding site found in the 3` untranslated re-

gion of multiple transcripts of mRNA encoded by DCX, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DCX BINDING SITE, designated SEQ ID:16590, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28409] Another function of GAM189 is therefore inhibition of Doublecortex; lissencephaly, x-linked (doublecortin) (DCX, Accession NP_835366.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCX.

[28410] Desmin (DES, Accession NP_001918.2) is another GAM189 target gene, herein designated TARGET GENE. DES BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DES, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DES BINDING SITE, designated SEQ ID:14498, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28411] Another function of GAM189 is therefore inhibition of

Desmin (DES, Accession NP_001918.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DES.

[28412] Dna fragmentation factor, 40kda, beta polypeptide (caspase-activated dnase) (DFFB, Accession NP_004393.1) is another GAM189 target gene, herein designated TARGET GENE. DFFB BINDING SITE1 and DFFB BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by DFFB, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DFFB BINDING SITE1 and DFFB BINDING SITE2, designated SEQ ID:9091 and SEQ ID:2019 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28413] Another function of GAM189 is therefore inhibition of Dna fragmentation factor, 40kda, beta polypeptide (caspase-activated dnase) (DFFB, Accession NP_004393.1), a gene which induces DNA fragmentation and chromatin condensation during apoptosis. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with DFFB.

[28414] The function of DFFB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM130.1.Dihydrofolate reductase (DHFR, Accession NP_000782.1) is another GAM189 target gene, herein designated TARGET GENE. DHFR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DHFR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DHFR BINDING SITE, designated SEQ ID:8052, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28415] Another function of GAM189 is therefore inhibition of Dihydrofolate reductase (DHFR, Accession NP_000782.1), a gene which converts dihydrofolate into tetrahydrofolate. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DHFR.

[28416] The function of DHFR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to GAM64.1.Diaphanous homolog 2 (drosophila) (DIAPH2, Accession NP_006720.1) is another GAM189 target gene, herein designated TARGET GENE. DIAPH2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DIAPH2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DIAPH2 BINDING SITE, designated SEQ ID:14492, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28417] Another function of GAM189 is therefore inhibition of Diaphanous homolog 2 (drosophila) (DIAPH2, Accession NP_006720.1), a gene which may affect in oogenesis and therefore may be associated with Premature ovarian failure . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Premature ovarian failure ., and of other diseases and clinical conditions associated with DIAPH2.

[28418] The function of DIAPH2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM66.1.Disrupted in schizophrenia 1 (DISC1, Acces-

sion NP_061132.1) is another GAM189 target gene, herein designated TARGET GENE. DISC1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DISC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DISC1 BINDING SITE, designated SEQ ID:1298, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28419] Another function of GAM189 is therefore inhibition of Disrupted in schizophrenia 1 (DISC1, Accession NP_061132.1), a gene which has globular N- terminal domain(s) and a helical C- terminal domain. and therefore may be associated with Schizophrenia . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Schizophrenia ., and of other diseases and clinical conditions associated with DISC1.

[28420] The function of DISC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM116.1.DKFZP434B1727 (Accession NP_115519.1) is another GAM189 target gene, herein designated TARGET GENE. DKFZP434B1727 BINDING SITE is a target bind-

ing site found in the 3` untranslated region of mRNA encoded by DKFZP434B1727, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434B1727 BINDING SITE, designated SEQ ID:4014, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28421] Another function of GAM189 is therefore inhibition of DKFZP434B1727 (Accession NP_115519.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434B1727.

[28422] DKFZp434C0923 (Accession NP_060068.1) is another GAM189 target gene, herein designated TARGET GENE. DKFZp434C0923 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp434C0923, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434C0923 BINDING SITE, designated SEQ ID:8235, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:246.

[28423] Another function of GAM189 is therefore inhibition of DKFZp434C0923 (Accession NP_060068.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434C0923.

[28424] DKFZP434C212 (Accession XP_044196.3) is another GAM189 target gene, herein designated TARGET GENE. DKFZP434C212 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP434C212, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434C212 BINDING SITE, designated SEQ ID:8661, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28425] Another function of GAM189 is therefore inhibition of DKFZP434C212 (Accession XP_044196.3) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434C212.

[28426] DKFZP434D146 (Accession NP_056410.2) is another

GAM189 target gene, herein designated TARGET GENE. DKFZP434D146 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP434D146, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434D146 BINDING SITE, designated SEQ ID:2209, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28427] Another function of GAM189 is therefore inhibition of DKFZP434D146 (Accession NP_056410.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434D146.

[28428] DKFZp434E2220 (Accession NP_060082.1) is another GAM189 target gene, herein designated TARGET GENE. DKFZp434E2220 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZp434E2220, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434E2220 BINDING SITE,

designated SEQ ID:11326, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28429] Another function of GAM189 is therefore inhibition of DKFZp434E2220 (Accession NP_060082.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434E2220.

[28430] DKFZP434F0318 (Accession NP_110444.1) is another GAM189 target gene, herein designated TARGET GENE. DKFZP434F0318 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP434F0318, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434F0318 BINDING SITE, designated SEQ ID:16771, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28431] Another function of GAM189 is therefore inhibition of DKFZP434F0318 (Accession NP_110444.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZP434F0318.

[28432] DKFZp434F1719 (Accession NP_115624.1) is another GAM189 target gene, herein designated TARGET GENE. DKFZp434F1719 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp434F1719, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434F1719 BINDING SITE, designated SEQ ID:3951, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28433] Another function of GAM189 is therefore inhibition of DKFZp434F1719 (Accession NP_115624.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434F1719.

[28434] DKFZp434K1210 (Accession NP_060076.1) is another GAM189 target gene, herein designated TARGET GENE. DKFZp434K1210 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp434K1210, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434K1210 BINDING SITE, designated SEQ ID:4195, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28435] Another function of GAM189 is therefore inhibition of DKFZp434K1210 (Accession NP_060076.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434K1210.

[28436] DKFZp547H025 (Accession NP_064546.1) is another GAM189 target gene, herein designated TARGET GENE. DKFZp547H025 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp547H025, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp547H025 BINDING SITE, designated SEQ ID:14246, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28437] Another function of GAM189 is therefore inhibition of DKFZp547H025 (Accession NP_064546.1) . Accordingly, util-

ities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547H025.

[28438] DKFZp547P234 (Accession NP_694590.1) is another GAM189 target gene, herein designated TARGET GENE. DKFZp547P234 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp547P234, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp547P234 BINDING SITE, designated SEQ ID:11057, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28439] Another function of GAM189 is therefore inhibition of DKFZp547P234 (Accession NP_694590.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547P234.

[28440] DKFZP564G092 (Accession NP_056416.1) is another GAM189 target gene, herein designated TARGET GENE. DKFZP564G092 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by

DKFZP564G092, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP564G092 BINDING SITE, designated SEQ ID:2662, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28441] Another function of GAM189 is therefore inhibition of DKFZP564G092 (Accession NP_056416.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564G092.

[28442] DKFZP564I122 (Accession XP_032397.1) is another GAM189 target gene, herein designated TARGET GENE. DKFZP564I122 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP564I122, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP564I122 BINDING SITE, designated SEQ ID:16590, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28443] Another function of GAM189 is therefore inhibition of DKFZP564I122 (Accession XP_032397.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564I122.

[28444] DKFZP564K0322 (Accession NP_114429.1) is another GAM189 target gene, herein designated TARGET GENE. DKFZP564K0322 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP564K0322, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP564K0322 BINDING SITE, designated SEQ ID:17964, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28445] Another function of GAM189 is therefore inhibition of DKFZP564K0322 (Accession NP_114429.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564K0322.

[28446] DKFZp564K142 (Accession NP_115497.2) is another GAM189 target gene, herein designated TARGET GENE.

DKFZp564K142 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp564K142, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp564K142 BINDING SITE, designated SEQ ID:2663, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28447] Another function of GAM189 is therefore inhibition of DKFZp564K142 (Accession NP_115497.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp564K142.

[28448] DKFZP564O0523 (Accession NP_115496.1) is another GAM189 target gene, herein designated TARGET GENE. DKFZP564O0523 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP564O0523, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP564O0523 BINDING SITE, designated SEQ ID:3686, to the nucleotide sequence of

GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28449] Another function of GAM189 is therefore inhibition of DKFZP564O0523 (Accession NP_115496.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O0523.

[28450] DKFZP566D1346 (Accession NP_110443.1) is another GAM189 target gene, herein designated TARGET GENE. DKFZP566D1346 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZP566D1346, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP566D1346 BINDING SITE, designated SEQ ID:10539, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28451] Another function of GAM189 is therefore inhibition of DKFZP566D1346 (Accession NP_110443.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566D1346.

[28452] DKFZP566I1024 (Accession NP_056226.1) is another GAM189 target gene, herein designated TARGET GENE. DKFZP566I1024 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP566I1024, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP566I1024 BINDING SITE, designated SEQ ID:12353, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28453] Another function of GAM189 is therefore inhibition of DKFZP566I1024 (Accession NP_056226.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566I1024.

[28454] DKFZp586C0721 (Accession XP_098416.1) is another GAM189 target gene, herein designated TARGET GENE. DKFZp586C0721 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp586C0721, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of DKFZp586C0721 BINDING SITE, designated SEQ ID:12173, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28455] Another function of GAM189 is therefore inhibition of DKFZp586C0721 (Accession XP_098416.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp586C0721.

[28456] DKFZP586D0919 (Accession NP_056248.1) is another GAM189 target gene, herein designated TARGET GENE. DKFZP586D0919 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP586D0919, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP586D0919 BINDING SITE, designated SEQ ID:11134, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28457] Another function of GAM189 is therefore inhibition of DKFZP586D0919 (Accession NP_056248.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZP586D0919.

[28458] DKFZp667B1218 (Accession NP_808881.1) is another GAM189 target gene, herein designated TARGET GENE. DKFZp667B1218 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp667B1218, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp667B1218 BINDING SITE, designated SEQ ID:15574, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28459] Another function of GAM189 is therefore inhibition of DKFZp667B1218 (Accession NP_808881.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp667B1218.

[28460] DKFZp667E0512 (Accession XP_117353.1) is another GAM189 target gene, herein designated TARGET GENE. DKFZp667E0512 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp667E0512, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp667E0512 BINDING SITE, designated SEQ ID:8492, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28461] Another function of GAM189 is therefore inhibition of DKFZp667E0512 (Accession XP_117353.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp667E0512.

[28462] DKFZp761B107 (Accession NP_775734.1) is another GAM189 target gene, herein designated TARGET GENE. DKFZp761B107 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp761B107, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761B107 BINDING SITE, designated SEQ ID:13571, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28463] Another function of GAM189 is therefore inhibition of DK-

FZp761B107 (Accession NP_775734.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761B107.

[28464] DKFZp761B128 (Accession NP_689650.1) is another GAM189 target gene, herein designated TARGET GENE. DKFZp761B128 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZp761B128, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761B128 BINDING SITE, designated SEQ ID:17969, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28465] Another function of GAM189 is therefore inhibition of DKFZp761B128 (Accession NP_689650.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761B128.

[28466] DKFZp761G2113 (Accession XP_046017.3) is another GAM189 target gene, herein designated TARGET GENE. DKFZp761G2113 BINDING SITE is a target binding site

found in the 3` untranslated region of mRNA encoded by DKFZp761G2113, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761G2113 BINDING SITE, designated SEQ ID:7769, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28467] Another function of GAM189 is therefore inhibition of DKFZp761G2113 (Accession XP_046017.3) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761G2113.

[28468] DKFZp761H039 (Accession NP_061181.1) is another GAM189 target gene, herein designated TARGET GENE. DKFZp761H039 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp761H039, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761H039 BINDING SITE, designated SEQ ID:15190, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:246.

[28469] Another function of GAM189 is therefore inhibition of DKFZp761H039 (Accession NP_061181.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761H039.

[28470] DKFZp761J139 (Accession NP_115656.1) is another GAM189 target gene, herein designated TARGET GENE. DKFZp761J139 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZp761J139, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761J139 BINDING SITE, designated SEQ ID:5768, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28471] Another function of GAM189 is therefore inhibition of DKFZp761J139 (Accession NP_115656.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761J139.

[28472] DKFZp761K1423 (Accession NP_060892.1) is another

GAM189 target gene, herein designated TARGET GENE. DKFZp761K1423 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZp761K1423, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761K1423 BINDING SITE, designated SEQ ID:1317, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28473] Another function of GAM189 is therefore inhibition of DKFZp761K1423 (Accession NP_060892.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761K1423.

[28474] DKFZp761N1114 (Accession XP_086327.6) is another GAM189 target gene, herein designated TARGET GENE. DKFZp761N1114 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp761N1114, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761N1114 BINDING SITE,

designated SEQ ID:13529, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28475] Another function of GAM189 is therefore inhibition of DKFZp761N1114 (Accession XP_086327.6) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761N1114.

[28476] DKFZp761O0113 (Accession NP_060879.1) is another GAM189 target gene, herein designated TARGET GENE. DKFZp761O0113 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZp761O0113, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761O0113 BINDING SITE, designated SEQ ID:7699, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28477] Another function of GAM189 is therefore inhibition of DKFZp761O0113 (Accession NP_060879.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZp761O0113.

[28478] DKFZp761P1121 (Accession NP_690870.1) is another GAM189 target gene, herein designated TARGET GENE. DKFZp761P1121 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp761P1121, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761P1121 BINDING SITE, designated SEQ ID:9147, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28479] Another function of GAM189 is therefore inhibition of DKFZp761P1121 (Accession NP_690870.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761P1121.

[28480] DKFZp762C2414 (Accession NP_848637.1) is another GAM189 target gene, herein designated TARGET GENE. DKFZp762C2414 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp762C2414, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp762C2414 BINDING SITE, designated SEQ ID:4056, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28481] Another function of GAM189 is therefore inhibition of DKFZp762C2414 (Accession NP_848637.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762C2414.

[28482] DKFZp762I137 (Accession NP_689624.1) is another GAM189 target gene, herein designated TARGET GENE. DKFZp762I137 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp762I137, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp762I137 BINDING SITE, designated SEQ ID:1744, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28483] Another function of GAM189 is therefore inhibition of DKFZp762I137 (Accession NP_689624.1) . Accordingly, utili-

ties of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762I137.

[28484] DKFZp762I194 (Accession NP_689597.1) is another GAM189 target gene, herein designated TARGET GENE. DKFZp762I194 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp762I194, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp762I194 BINDING SITE, designated SEQ ID:6884, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28485] Another function of GAM189 is therefore inhibition of DKFZp762I194 (Accession NP_689597.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762I194.

[28486] DKFZp762L0311 (Accession NP_061189.2) is another GAM189 target gene, herein designated TARGET GENE. DKFZp762L0311 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by

DKFZp762L0311, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp762L0311 BINDING SITE, designated SEQ ID:9194, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28487] Another function of GAM189 is therefore inhibition of DKFZp762L0311 (Accession NP_061189.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762L0311.

[28488] Dickkopf homolog 3 (xenopus laevis) (DKK3, Accession NP_037385.1) is another GAM189 target gene, herein designated TARGET GENE. DKK3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DKK3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKK3 BINDING SITE, designated SEQ ID:20069, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28489] Another function of GAM189 is therefore inhibition of Dickkopf homolog 3 (xenopus laevis) (DKK3, Accession NP_037385.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKK3.

[28490] Dickkopf homolog 3 (xenopus laevis) (DKK3, Accession NP_056965.2) is another GAM189 target gene, herein designated TARGET GENE. DKK3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DKK3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKK3 BINDING SITE, designated SEQ ID:20069, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28491] Another function of GAM189 is therefore inhibition of Dickkopf homolog 3 (xenopus laevis) (DKK3, Accession NP_056965.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKK3.

[28492] Dynein, axonemal, heavy polypeptide 11 (DNAH11, Accession NP_003768.1) is another GAM189 target gene,

herein designated TARGET GENE. DNAH11 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DNAH11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DNAH11 BINDING SITE, designated SEQ ID:1214, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28493] Another function of GAM189 is therefore inhibition of Dynein, axonemal, heavy polypeptide 11 (DNAH11, Accession NP_003768.1), a gene which may function as a motor protein. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAH11.

[28494] The function of DNAH11 has been established by previous studies. Inversus viscerum (iv/iv) mice exhibit randomized left- right patterning; half of iv/iv homozygotes develop situs inversus (Okada et al., 1999; Supp et al., 1999). To examine how flow affects left- right patterning, Nonaka et al. (2002) developed a system in which mouse embryos are cultured under an artificial fluid flow. This artificial flow was able to direct the situs of mutant mouse em-

bryos with immotile cilia. Nonaka et al. (2002) concluded that their results provided the first evidence for the role of mechanical fluid flow in left- right patterning.

[28495] Animal model experiments lend further support to the function of DNAH11. Inversus viscerum (iv/iv) mice exhibit randomized left- right patterning; half of iv/iv homozygotes develop situs inversus (Okada et al., 1999; Supp et al., 1999). To examine how flow affects left- right patterning, Nonaka et al. (2002) developed a system in which mouse embryos are cultured under an artificial fluid flow. This artificial flow was able to direct the situs of mutant mouse embryos with immotile cilia. Nonaka et al. (2002) concluded that their results provided the first evidence for the role of mechanical fluid flow in left- right patterning.

[28496] It is appreciated that the abovementioned animal model for DNAH11 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[28497] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28498] McGrath, J.; Horwich, A. L.; Brueckner, M. : Duplication/deficiency mapping of situs inversus viscerum (iv), a gene

that determines left- right asymmetry in the mouse. Genomics 14: 643- 648, 1992. ; and

[28499] Nonaka, S.; Shiratori, H.; Saijoh, Y.; Hamada, H. : Determination of left- right patterning of the mouse embryo by artificial nodal flow. Nature 418: 96- 99, 2002.

[28500] Further studies establishing the function and utilities of DNAH11 are found in John Hopkins OMIM database record ID 603339, and in cited publications listed in Table 5, which are hereby incorporated by reference.Dnaj (hsp40) homolog, subfamily b, member 5 (DNAJB5, Accession NP_036398.2) is another GAM189 target gene, herein designated TARGET GENE. DNAJB5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DNAJB5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DNAJB5 BINDING SITE, designated SEQ ID:5815, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28501] Another function of GAM189 is therefore inhibition of Dnaj (hsp40) homolog, subfamily b, member 5 (DNAJB5, Accession NP_036398.2) . Accordingly, utilities of

GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAJB5.

[28502] DRIM (Accession NP_055318.1) is another GAM189 target gene, herein designated TARGET GENE. DRIM BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DRIM, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DRIM BINDING SITE, designated SEQ ID:6633, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28503] Another function of GAM189 is therefore inhibition of DRIM (Accession NP_055318.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DRIM.

[28504] Dentatorubral-pallidoluysian atrophy (atrophin-1) (DRPLA, Accession NP_001931.1) is another GAM189 target gene, herein designated TARGET GENE. DRPLA BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DRPLA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementar-

ity of the nucleotide sequences of DRPLA BINDING SITE, designated SEQ ID:9796, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28505] Another function of GAM189 is therefore inhibition of Dentatorubral-pallidoluysian atrophy (atrophin-1) (DRPLA, Accession NP_001931.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DRPLA.

[28506] Desmocollin 3 (DSC3, Accession NP_001932.1) is another GAM189 target gene, herein designated TARGET GENE. DSC3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DSC3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DSC3 BINDING SITE, designated SEQ ID:7559, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28507] Another function of GAM189 is therefore inhibition of Desmocollin 3 (DSC3, Accession NP_001932.1), a gene which is a component of intercellular desmosome junctions. Accordingly, utilities of GAM189 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with DSC3.

[28508] The function of DSC3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Desmocollin 3 (DSC3, Accession NP_077741.1) is another GAM189 target gene, herein designated TARGET GENE. DSC3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DSC3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DSC3 BINDING SITE, designated SEQ ID:7559, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28509] Another function of GAM189 is therefore inhibition of Desmocollin 3 (DSC3, Accession NP_077741.1), a gene which is a component of intercellular desmosome junctions. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSC3.

[28510] The function of DSC3 and its association with various dis-

eases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Down syndrome critical region gene 6 (DSCR6, Accession NP_061835.1) is another GAM189 target gene, herein designated TARGET GENE. DSCR6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DSCR6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DSCR6 BINDING SITE, designated SEQ ID:14954, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28511] Another function of GAM189 is therefore inhibition of Down syndrome critical region gene 6 (DSCR6, Accession NP_061835.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSCR6.

[28512] Dual specificity phosphatase 19 (DUSP19, Accession NP_543152.1) is another GAM189 target gene, herein designated TARGET GENE. DUSP19 BINDING SITE1 and DUSP19 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by DUSP19, corre-

sponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DUSP19 BINDING SITE1 and DUSP19 BINDING SITE2, designated SEQ ID:5768 and SEQ ID:15367 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28513] Another function of GAM189 is therefore inhibition of Dual specificity phosphatase 19 (DUSP19, Accession NP_543152.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DUSP19.

[28514] Endometrial bleeding associated factor (left-right determination, factor a; transforming growth factor beta superfamily) (EBAF, Accession NP_003231.2) is another GAM189 target gene, herein designated TARGET GENE. EBAF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EBAF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EBAF BINDING SITE, designated SEQ ID:18275, to the nucleotide sequence of GAM189 RNA, herein designated

GAM RNA, also designated SEQ ID:246.

[28515] Another function of GAM189 is therefore inhibition of Endometrial bleeding associated factor (left-right determination, factor a; transforming growth factor beta superfamily) (EBAF, Accession NP_003231.2), a gene which LEFT- RIGHT AXIS MALFORMATIONS and therefore is associated with Left- right axis malformations. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Left- right axis malformations, and of other diseases and clinical conditions associated with EBAF.

[28516] The function of EBAF has been established by previous studies. Because of the possibility that Lefty mutations may be associated with human L- R axis malformations, Kosaki et al. (1999) characterized 2 human homologs, LEFTY A and LEFTY B (OMIM Ref. No. 603037). PCR screening of a PAC genomic library identified a clone that contained both LEFTY A and LEFTY B genes. Restriction mapping showed that the genes are separated by approximately 50 kb and are oriented in tandem. The 2 genes were localized by FISH to 1q42, a region syntenic to the location to which the mouse Lefty genes have been mapped at 1H5 (Meno et al., 1997). Both LEFTY A and LEFTY B contain 4 exons which are spliced at identical po-

sitions, and both genes encode proteins with 366 amino acids. LEFTY A was found to be identical to EBAF, the cDNA previously identified by Kothapalli et al. (1997). The deduced amino acid sequences of LEFTY A and LEFTY B are more similar to each other than to Lefty- 1 or Lefty- 2 of the mouse. Analysis of 126 human cases of L- R axis malformation showed 1 nonsense and 1 missense mutation in the LEFTY A gene. Both mutations lay in the cysteine- knot region of the LEFTY A protein, and the phenotype of affected individuals was very similar to that typically seen in Lefty- 1 - /- mice with L- R axis malformations. Because of the possibility that Lefty mutations may be associated with human L- R axis malformations, Kosaki et al. (1999) characterized 2 human homologs, LEFTY A and LEFTY B (OMIM Ref. No. 603037). PCR screening of a PAC genomic library identified a clone that contained both LEFTY A and LEFTY B genes. Restriction mapping showed that the genes are separated by approximately 50 kb and are oriented in tandem. The 2 genes were localized by FISH to 1q42, a region syntenic to the location to which the mouse Lefty genes have been mapped at 1H5 (Meno et al., 1997). Both LEFTY A and LEFTY B contain 4 exons which are spliced at identical positions, and both genes

encode proteins with 366 amino acids. LEFTY A was found to be identical to EBAF, the cDNA previously identified by Kothapalli et al. (1997). The deduced amino acid sequences of LEFTY A and LEFTY B are more similar to each other than to Lefty- 1 or Lefty- 2 of the mouse. Analysis of 126 human cases of L- R axis malformation showed 1 nonsense and 1 missense mutation in the LEFTY A gene. Both mutations lay in the cysteine- knot region of the LEFTY A protein, and the phenotype of affected individuals was very similar to that typically seen in Lefty- 1 - /- mice with L- R axis malformations.

[28517] Animal model experiments lend further support to the function of EBAF. Lefty- 1, lefty- 2, and nodal (OMIM Ref. No. 601265) are expressed on the left side of developing mouse embryos and are implicated in L- R determination. Meno et al. (1998) examined the role of lefty- 1 by analyzing mutant mice lacking this gene. The lefty- 1- deficient mice showed a variety of L- R positional defects in visceral organs. The most common feature of lefty- 1 - /- mice was thoracic left isomerism (rather than right isomerism). The lack of lefty- 1 resulted in bilateral expression of nodal, lefty- 2, and Pitx2 (OMIM Ref. No. 601542), a homeo box gene normally expressed on the left side.

These observations suggested that the role of lefty- 1 is to restrict the expression of lefty- 2 and nodal to the left side, and that lefty- 2 or nodal encode a signal for 'left-ness.'

[28518] It is appreciated that the abovementioned animal model for EBAF is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[28519] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28520] Kosaki, K.; Bassi, M. T.; Kosaki, R.; Lewin, M.; Belmont, J.; Schauer, G.; Casey, B. : Characterization and mutation analysis of human LEFTY A and LEFTY B, homologues of murine genes implicated in left- right axis development. Am. J. Hum. Genet. 64: 712- 721, 1999. ; and

[28521] Meno, C.; Shimono, A.; Saijoh, Y.; Yashiro, K.; Mochida, K.; Ohishi, S.; Noji, S.; Kondoh, H.; Hamada, H. : Lefty- 1 is required for left- right determination as a regulator of lefty- 2 an.

[28522] Further studies establishing the function and utilities of EBAF are found in John Hopkins OMIM database record ID 601877, and in cited publications listed in Table 5, which

are hereby incorporated by reference.Endothelial differentiation, sphingolipid g-protein-coupled receptor, 8 (EDG8, Accession NP_110387.1) is another GAM189 target gene, herein designated TARGET GENE. EDG8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EDG8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EDG8 BINDING SITE, designated SEQ ID:12263, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28523] Another function of GAM189 is therefore inhibition of Endothelial differentiation, sphingolipid g-protein-coupled receptor, 8 (EDG8, Accession NP_110387.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDG8.

[28524] EEF2K (Accession NP_037434.1) is another GAM189 target gene, herein designated TARGET GENE. EEF2K BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EEF2K, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II

or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EEF2K BINDING SITE, designated SEQ ID:2595, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28525] Another function of GAM189 is therefore inhibition of EEF2K (Accession NP_037434.1), a gene which phosphorylates serine or threonine on the eukaryotic elongation factor- 2 and therefore may be associated with Systemic lupus erythematosus and cancer. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Systemic lupus erythematosus and cancer, and of other diseases and clinical conditions associated with EEF2K.

[28526] The function of EEF2K has been established by previous studies. Using degenerate PCR primers based on worm and rabbit peptide sequences for Eef2k, followed by 5- prime and 3- prime RACE and RT- PCR on a glioma cell line, Ryazanov et al. (1997) obtained cDNAs encoding rodent and human EEF2K. The deduced 725- amino acid human protein is 90% identical to the rodent proteins. EEF2K lacks homology to other serine/threonine kinases or to other calmodulin- dependent kinases, apart from a glycine- rich loop that is part of the ATP- binding site. All

EEF2K sequences contain a highly- conserved 200- residue catalytic domain. There is also a conserved C- terminal coiled- coil region. SDS- PAGE and functional analysis showed expression of a 100- kD protein whose activity was strictly calmodulin- dependent. Northern blot analysis revealed ubiquitous expression of a major 3.1- kb transcript and minor 6.1- and 2.5- kb transcripts. Expression was particularly abundant in heart and skeletal muscle, suggesting that EEF2 phosphorylation may be particularly important in muscle. Arora et al. (2002) found that a majority of patients with systemic lupus erythematosus (SLE; 152700) have high titer anti- EEF2K antibodies capable of immunoprecipitating functional enzyme.

[28527]

[28528] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28529] Ryazanov, A. G.; Ward, M. D.; Mendola, C. E.; Pavur, K. S.; Dorovkov, M. V.; Wiedmann, M.; Erdjument- Bromage, H.; Tempst, P.; Parmer, T. G.; Prostko, C. R.; Germino, F. J.; Hait, W. N. : Identification of a new class of protein kinases represented by eukaryotic elongation factor- 2 ki-

nase. Proc. Nat. Acad. Sci. 94: 4884- 4889, 1997. ; and

[28530] Arora, S.; Yang, J.- M.; Craft, J.; Hait, W. : Detection of anti- elongation factor 2 kinase (calmodulin- dependent protein kinase III) antibodies in patients with systemic lupus erythemato.

[28531] Further studies establishing the function and utilities of EEF2K are found in John Hopkins OMIM database record ID 606968, and in cited publications listed in Table 5, which are hereby incorporated by reference.Eh-domain containing 1 (EHD1, Accession NP_006786.2) is another GAM189 target gene, herein designated TARGET GENE. EHD1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EHD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EHD1 BINDING SITE, designated SEQ ID:7065, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28532] Another function of GAM189 is therefore inhibition of Eh-domain containing 1 (EHD1, Accession NP_006786.2), a gene which may be involved in ligand- initiated endocytosis. Accordingly, utilities of GAM189 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with EHD1.

[28533] The function of EHD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM65.1.Eh-domain containing 2 (EHD2, Accession NP_055416.2) is another GAM189 target gene, herein designated TARGET GENE. EHD2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EHD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EHD2 BINDING SITE, designated SEQ ID:4837, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28534] Another function of GAM189 is therefore inhibition of Eh-domain containing 2 (EHD2, Accession NP_055416.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EHD2.

[28535] Eukaryotic translation initiation factor 2, subunit 3 gamma, 52kda (EIF2S3, Accession NP_001406.1) is another GAM189 target gene, herein designated TARGET

GENE. EIF2S3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EIF2S3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EIF2S3 BINDING SITE, designated SEQ ID:1744, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28536] Another function of GAM189 is therefore inhibition of Eukaryotic translation initiation factor 2, subunit 3 gamma, 52kda (EIF2S3, Accession NP_001406.1), a gene which functions in the early steps of protein synthesis. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF2S3.

[28537] The function of EIF2S3 has been established by previous studies. Translation initiation factor eIF- 2 is a heterotrimeric GTP- binding protein involved in the recruitment of methionyl- tRNA(i) to the 40 S ribosomal subunit. Gasper et al. (1994) cloned a human cDNA encoding the largest subunit of eIF- 2, EIF2G. The EIF2G cDNA encodes a 472- amino acid protein with a molecular mass of 51.8 kD and contains 3 consensus GTP- binding elements. Hu-

man EIF2G is highly related to the yeast homolog, GCD11, exhibiting 71% sequence identity and an additional 13% similarity. Genes controlling the functions of spermatogenesis, Spy, and expression of the male- specific minor transplantation antigen H- Y, Hya (OMIM Ref. No. 426000), map to a region of the short arm of the mouse Y chromosome, delta- Sxr(b), that lies between the zinc finger genes Zfy1 and Zfy2 (OMIM Ref. No. 490000) and is deleted in Sxr(b) mutant mice. These Sxr(b) mice arose from an original sex- reversed mutation, Sxr(a), that carries a duplication of most of the Y chromosome short arm translocated to the telomeric end of the pseudoautosomal region of the Y chromosome. Several genes were mapped to that interval of the mouse Y chromosome and each was found to have a homolog on the X chromosome. Four of them, Zfy1 and Zfy2 (OMIM Ref. No. 490000), Ube1y (OMIM Ref. No. 489000), and Dffry (OMIM Ref. No. 400005), are expressed specifically in the testis and their X homologs (Zfx, 314980; Ube1x, 314370; Dffrx, 300072) are not transcribed from the inactive X chromosome. A further 2, Smyc (OMIM Ref. No. 426000) and Uty (OMIM Ref. No. 400009), are ubiquitously expressed and their X homologs (Smcx, 314690; Utx, 300128) escape X inacti-

vation. Ehrmann et al. (1998) identified another gene from this region of the mouse Y chromosome. It was found to encode the highly conserved eukaryotic translation initiation factor eIF- 2- gamma. In the mouse this gene was found to be ubiquitously expressed, to have an X chromosome homolog that maps close to Dmd (OMIM Ref. No. 300377), and to escape X inactivation. The coding regions of the X and Y genes show 86% nucleotide identity and encode the putative products with 98% amino acid identity. Ehrmann et al. (1998) found that the human homolog is located on Xp21 and also escapes X inactivation. No evidence of a Y copy of this gene was found in humans, however. In both humans and mice, Ehrmann et al. (1998) identified autosomal retroposons of EIF2G in both humans and mice and an additional retroposon on the X chromosome in some mouse strains. Ark blot analysis of eutherian and metatherian genomic DNA indicated that X- Y homologs are present in all species tested except in simian primates and kangaroo and that retroposons are common to a wide range of mammals. ('Zoo blots' are Southern blots of genomic DNA from multiple species without regard to gender; 'ark blots' are Southern blots used to compare male and female from multiple species.)

[28538]

[28539] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28540] Ehrmann, I. E.; Ellis, P. S.; Mazeyrat, S.; Duthie, S.; Brock- dorff, N.; Mattei, M. G.; Gavin, M. A.; Affara, N. A.; Brown, G. M.; Simpson, E.; Mitchell, M. J.; Scott, D. M. : Character- ization of genes encoding translation initiation factor eIF- 2- gamma in mouse and human: sex chromosome local- ization, escape from X- inactivation and evolution. Hum. Molec. Genet. 7: 1725- 1737, 1998. ; and

[28541] Gasper, N. J.; Kinzy, T. G.; Scherer, B. J.; Humbelin, M.; Hershey, J. W. B.; Merrick, W. C. : Translation initiation factor eIF- 2: cloning and expression of the human cDNA encoding the.

[28542] Further studies establishing the function and utilities of EIF2S3 are found in John Hopkins OMIM database record ID 300161, and in cited publications listed in Table 5, which are hereby incorporated by reference.Eukaryotic translation initiation factor 5a2 (EIF5A2, Accession NP_065123.1) is another GAM189 target gene, herein designated TARGET GENE. EIF5A2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by EIF5A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EIF5A2 BINDING SITE, designated SEQ ID:8340, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28543] Another function of GAM189 is therefore inhibition of Eukaryotic translation initiation factor 5a2 (EIF5A2, Accession NP_065123.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF5A2.

[28544] ELP3 (Accession NP_060561.3) is another GAM189 target gene, herein designated TARGET GENE. ELP3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ELP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ELP3 BINDING SITE, designated SEQ ID:14236, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28545] Another function of GAM189 is therefore inhibition of ELP3 (Accession NP_060561.3) . Accordingly, utilities of

GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELP3.

[28546] Egf-like module containing, mucin-like, hormone receptor-like sequence 2 (EMR2, Accession NP_690884.1) is another GAM189 target gene, herein designated TARGET GENE. EMR2 BINDING SITE1 and EMR2 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by EMR2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EMR2 BINDING SITE1 and EMR2 BINDING SITE2, designated SEQ ID:13462 and SEQ ID:17743 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28547] Another function of GAM189 is therefore inhibition of Egf-like module containing, mucin-like, hormone receptor-like sequence 2 (EMR2, Accession NP_690884.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMR2.

[28548] Egf-like module containing, mucin-like, hormone receptor-like sequence 2 (EMR2, Accession NP_690884.1) is

another GAM189 target gene, herein designated TARGET GENE. EMR2 BINDING SITE1 and EMR2 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by EMR2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EMR2 BINDING SITE1 and EMR2 BINDING SITE2, designated SEQ ID:17743 and SEQ ID:13462 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28549] Another function of GAM189 is therefore inhibition of Egf-like module containing, mucin-like, hormone receptor-like sequence 2 (EMR2, Accession NP_690884.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMR2.

[28550] Egf-like module containing, mucin-like, hormone receptor-like sequence 2 (EMR2, Accession NP_690885.1) is another GAM189 target gene, herein designated TARGET GENE. EMR2 BINDING SITE1 and EMR2 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by EMR2, correspond-

ing to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EMR2 BINDING SITE1 and EMR2 BINDING SITE2, designated SEQ ID:17743 and SEQ ID:13462 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28551] Another function of GAM189 is therefore inhibition of Egf-like module containing, mucin-like, hormone receptor-like sequence 2 (EMR2, Accession NP_690885.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMR2.

[28552] Egf-like module containing, mucin-like, hormone receptor-like sequence 2 (EMR2, Accession NP_690880.1) is another GAM189 target gene, herein designated TARGET GENE. EMR2 BINDING SITE1 and EMR2 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by EMR2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EMR2 BINDING SITE1 and EMR2 BINDING SITE2, designated SEQ

ID:13462 and SEQ ID:17743 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28553] Another function of GAM189 is therefore inhibition of Egf-like module containing, mucin-like, hormone receptor-like sequence 2 (EMR2, Accession NP_690880.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMR2.

[28554] Egf-like module containing, mucin-like, hormone receptor-like sequence 2 (EMR2, Accession NP_690883.1) is another GAM189 target gene, herein designated TARGET GENE. EMR2 BINDING SITE1 and EMR2 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by EMR2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EMR2 BINDING SITE1 and EMR2 BINDING SITE2, designated SEQ ID:17743 and SEQ ID:17743 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28555] Another function of GAM189 is therefore inhibition of Egf-like module containing, mucin-like, hormone receptor-like sequence 2 (EMR2, Accession NP_690883.1) . Accordingly, utilities of GAM189 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with EMR2.

[28556] Egf-like module containing, mucin-like, hormone receptor-like sequence 2 (EMR2, Accession NP_690885.1) is another GAM189 target gene, herein designated TARGET GENE. EMR2 BINDING SITE1 and EMR2 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by EMR2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EMR2 BINDING SITE1 and EMR2 BINDING SITE2, designated SEQ ID:13462 and SEQ ID:13462 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28557] Another function of GAM189 is therefore inhibition of Egf-like module containing, mucin-like, hormone receptor-like sequence 2 (EMR2, Accession NP_690885.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMR2.

[28558] Egf-like module containing, mucin-like, hormone receptor-like sequence 2 (EMR2, Accession NP_038475.2) is

another GAM189 target gene, herein designated TARGET GENE. EMR2 BINDING SITE1 and EMR2 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by EMR2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EMR2 BINDING SITE1 and EMR2 BINDING SITE2, designated SEQ ID:17743 and SEQ ID:13462 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28559] Another function of GAM189 is therefore inhibition of Egf-like module containing, mucin-like, hormone receptor-like sequence 2 (EMR2, Accession NP_038475.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMR2.

[28560] Endonuclease g-like 1 (ENDOGL1, Accession NP_005098.1) is another GAM189 target gene, herein designated TARGET GENE. ENDOGL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ENDOGL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ENDOGL1 BINDING SITE, designated SEQ ID:5031, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28561] Another function of GAM189 is therefore inhibition of Endonuclease g-like 1 (ENDOGL1, Accession NP_005098.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENDOGL1.

[28562] Epha8 (EPHA8, Accession NP_065387.1) is another GAM189 target gene, herein designated TARGET GENE. EPHA8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EPHA8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EPHA8 BINDING SITE, designated SEQ ID:1229, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28563] Another function of GAM189 is therefore inhibition of Epha8 (EPHA8, Accession NP_065387.1), a gene which Eph- related receptor tyrosine kinase A8. Accordingly,

utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHA8.

[28564] The function of EPHA8 has been established by previous studies. See EPH (EPHA1; 179610) for background on Eph receptors and their ligands, the ephrins. Chan and Watt (1991) identified human and rat DNAs encoding 2 novel members of the EPH subclass of putative receptor protein- tyrosine kinases. Rat cDNA clones encoding EEK (EPH- and ELK- related kinase) were isolated from a brain cDNA library probed with DNA encoding the kinase region of the insulin receptor- related receptor (INSRR; 147671). The EEK protein was predicted to contain all the amino acid residues conserved in the catalytic domains of protein- tyrosine kinases and was most similar to 2 putative receptor protein- tyrosine kinases of the EPH subclass, ELK (EPHB1; 600600) and EPH, showing 69 and 57% identity, respectively. Human genomic DNAs, encoding part of EEK as well as another putative protein tyrosine kinase most similar to ELK (90%) and symbolized ERK (EPHB2; 600997) for ELK- related kinase, were isolated and partially characterized. The novel identity of these 2 EPH-family genes was further supported by Southern blot anal-

ysis and localization to human chromosome 1. In Northern blot analysis of rat RNA, DNAs encoding rat EEK and human ERK hybridized to transcripts most abundant in brain and lung, respectively. These 2 new members of the EPH subclass of receptor protein- tyrosine kinases, EEK and ERK, may therefore have tissue- specific functions distinct from those of the other EPH family members.

[28565] Animal model experiments lend further support to the function of EPHA8. Park et al. (1997) generated mice homozygous for a mutation that disrupts the gene encoding EPHA8, a member of the Eph family of tyrosine proteinase receptors. EphA8 - /- mice developed to term, were fertile, and did not display obvious anatomical or physiologic defects.

[28566] It is appreciated that the abovementioned animal model for EPHA8 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[28567] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28568] Chan, J.; Watt, V. M. : Eek and erk, new members of the eph subclass of receptor protein- tyrosine kinases. Onco-

gene 6: 1057- 1061, 1991. ; and

[28569] Park, S.; Frisen, J.; Barbacid, M. : Aberrant axonal projections in mice lacking EphA8 (Eek) tyrosine protein kinase receptors. EMBO J. 16: 3106- 3114, 1997.

[28570] Further studies establishing the function and utilities of EPHA8 are found in John Hopkins OMIM database record ID 176945, and in cited publications listed in Table 5, which are hereby incorporated by reference.Epiregulin (EREG, Accession NP_001423.1) is another GAM189 target gene, herein designated TARGET GENE. EREG BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EREG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EREG BINDING SITE, designated SEQ ID:17956, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28571] Another function of GAM189 is therefore inhibition of Epiregulin (EREG, Accession NP_001423.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EREG.

[28572] Ellis van creveld syndrome (EVC, Accession NP_714928.1) is another GAM189 target gene, herein designated TARGET GENE. EVC BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EVC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EVC BINDING SITE, designated SEQ ID:18115, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28573] Another function of GAM189 is therefore inhibition of Ellis van creveld syndrome (EVC, Accession NP_714928.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVC.

[28574] Ellis van creveld syndrome (EVC, Accession NP_055371.1) is another GAM189 target gene, herein designated TARGET GENE. EVC BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EVC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of

the nucleotide sequences of EVC BINDING SITE, designated SEQ ID:18115, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28575] Another function of GAM189 is therefore inhibition of Ellis van creveld syndrome (EVC, Accession NP_055371.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVC.

[28576] Ecotropic viral integration site 5 (EVI5, Accession NP_005656.2) is another GAM189 target gene, herein designated TARGET GENE. EVI5 BINDING SITE1 and EVI5 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by EVI5, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EVI5 BINDING SITE1 and EVI5 BINDING SITE2, designated SEQ ID:7219 and SEQ ID:11607 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28577] Another function of GAM189 is therefore inhibition of Ecotropic viral integration site 5 (EVI5, Accession

NP_005656.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVI5.

[28578] Enhancer of zeste homolog 1 (drosophila) (EZH1, Accession NP_001982.2) is another GAM189 target gene, herein designated TARGET GENE. EZH1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EZH1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EZH1 BINDING SITE, designated SEQ ID:14083, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28579] Another function of GAM189 is therefore inhibition of Enhancer of zeste homolog 1 (drosophila) (EZH1, Accession NP_001982.2), a gene which may act in transcriptional regulation and heterochromatin maintenance. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EZH1.

[28580] The function of EZH1 has been established by previous studies. Transcription mapping efforts within chromo-

some 17q21 identified a human homolog of the Drosophila gene 'enhancer of zeste' E(z). In Drosophila, the gene acts as a negative regulator of segment identity genes of the Antennapedia and Bithorax complexes. Abel et al. (1996) reported the full- length protein coding sequence of the human homolog, EZH1, and compared the respective protein sequences in human and Drosophila. EZH1 encodes a protein of 747 amino acids that displays 55% amino acid identity overall (70% similarity) with the Drosophila protein. The strong sequence conservation suggested potential roles for EZH1 in human development as a transcriptional regulator and as a component of protein complexes that stably maintain heterochromatin. EZH1 is expressed as 2 major transcripts in all adult and fetal human tissues surveyed; comparison of cloned cDNAs suggested that alternative splicing may account for at least part of the transcript size differences. Analysis of an EZH1 cDNA revealed an unusual splicing event involving EZH1 and a tandemly linked gene GPR2 (OMIM Ref. No. 600240) and suggested a potential mechanism for modifying the EZH1 protein in the conserved C- terminal domain. The GPR2 gene maps to 17q21.1- q21.3 in the vicinity of the BRCA1 gene (OMIM Ref. No. 113705). See

also EZH2 (OMIM Ref. No. 601573). By FISH, Laible et al. (1999) mapped the mouse Ezh1 gene to chromosome 11.

[28581]

[28582] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28583] Abel, K. J.; Brody, L. C.; Valdes, J. M.; Erdos, M. R.; McKinley, D. R.; Castilla, L. H.; Merajver, S. D.; Couch, F. J.; Friedman, L. S.; Ostermeyer, E. A.; Lynch, E. D.; King, M.-C.; Welcsh, P. L.; Osborne- Lawrence, S.; Spillman, M.; Bowcock, A. M.; Collins, F. S.; Weber, B. L. : Characterization of EZH1, a human homolog of Drosophila enhancer of zeste near BRCA1. Genomics 37: 161- 171, 1996. ; and

[28584] Laible, G.; Haynes, A. R.; Lebersorger, A.; O'Carroll, D.; Mattei, M.- G.; Denny, P.; Brown, S. D. M.; Jenuwein, T. : The murine polycomb- group genes Ezh1 and Ezh2 map close to Hox gene.

[28585] Further studies establishing the function and utilities of EZH1 are found in John Hopkins OMIM database record ID 601674, and in cited publications listed in Table 5, which are hereby incorporated by reference.F11R (Accession NP_653087.1) is another GAM189 target gene, herein designated TARGET GENE. F11R BINDING SITE is a target

binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by F11R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of F11R BINDING SITE, designated SEQ ID:2664, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28586] Another function of GAM189 is therefore inhibition of F11R (Accession NP_653087.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F11R.

[28587] F11R (Accession NP_653085.1) is another GAM189 target gene, herein designated TARGET GENE. F11R BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by F11R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of F11R BINDING SITE, designated SEQ ID:2664, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28588] Another function of GAM189 is therefore inhibition of

F11R (Accession NP_653085.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F11R.

[28589] F11R (Accession NP_653086.1) is another GAM189 target gene, herein designated TARGET GENE. F11R BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by F11R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of F11R BINDING SITE, designated SEQ ID:2664, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28590] Another function of GAM189 is therefore inhibition of F11R (Accession NP_653086.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F11R.

[28591] F11R (Accession NP_058642.1) is another GAM189 target gene, herein designated TARGET GENE. F11R BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by F11R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4

illustrates the complementarity of the nucleotide sequences of F11R BINDING SITE, designated SEQ ID:2664, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28592] Another function of GAM189 is therefore inhibition of F11R (Accession NP_058642.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F11R.

[28593] Coagulation factor ii (thrombin) receptor-like 3 (F2RL3, Accession NP_003941.1) is another GAM189 target gene, herein designated TARGET GENE. F2RL3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by F2RL3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of F2RL3 BINDING SITE, designated SEQ ID:4234, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28594] Another function of GAM189 is therefore inhibition of Coagulation factor ii (thrombin) receptor-like 3 (F2RL3, Accession NP_003941.1), a gene which Protease- activated receptor 4; G protein- coupled receptor that increases

phosphoinositide hydrolysis. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F2RL3.

[28595] The function of F2RL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM72.1.Coagulation factor iii (thromboplastin, tissue factor) (F3, Accession NP_001984.1) is another GAM189 target gene, herein designated TARGET GENE. F3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by F3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of F3 BINDING SITE, designated SEQ ID:18492, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28596] Another function of GAM189 is therefore inhibition of Coagulation factor iii (thromboplastin, tissue factor) (F3, Accession NP_001984.1), a gene which functions in normal hemostasis. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F3.

[28597] The function of F3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM136.1.Coagulation factor v (proaccelerin, labile factor) (F5, Accession NP_000121.1) is another GAM189 target gene, herein designated TARGET GENE. F5 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by F5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of F5 BINDING SITE, designated SEQ ID:7269, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28598] Another function of GAM189 is therefore inhibition of Coagulation factor v (proaccelerin, labile factor) (F5, Accession NP_000121.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F5.

[28599] Fatty acid binding protein 2, intestinal (FABP2, Accession NP_000125.1) is another GAM189 target gene, herein designated TARGET GENE. FABP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by FABP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FABP2 BINDING SITE, designated SEQ ID:2195, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28600] Another function of GAM189 is therefore inhibition of Fatty acid binding protein 2, intestinal (FABP2, Accession NP_000125.1), a gene which may have a role in dietary fat uptake or processing. and therefore may be associated with Cardiovascular disease and type 2 diabetes. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Cardiovascular disease and type 2 diabetes., and of other diseases and clinical conditions associated with FABP2.

[28601] The function of FABP2 has been established by previous studies. To test the hypothesis that the A54T FABP2 polymorphism is associated with impaired lipid metabolism and cardiovascular disease, Carlsson et al. (2000) compared clinical characteristics and a parental history of cardiovascular disease between 213 sib pairs discordant for the polymorphism. Sibs with an excess of the thr54 allele had higher triglyceride and cholesterol concentrations

than sibs with the ala54 allele. Parents of offspring with the thr/thr and thr/ala genotypes reported an increased prevalence of stroke compared to parents of offspring with the ala/ala genotype. The authors confirmed the association of the FABP2 thr54 allele with increased concentrations of cholesterol and triglycerides in genotype- discordant sib pairs. They also presented novel evidence that genetic variation in the FABP2 gene may increase susceptibility to stroke. To assess whether increased intestinal triglyceride input leads to elevated fasting and postprandial triglycerides in type 2 diabetes (NIDDM), Georgopoulos et al. (2000) studied the ala54- to- thr polymorphism of FABP2, which is associated with increased intestinal input of triglyceride. Of the 287 diabetic patients screened, 108 (37.6%) were heterozygous and 31 (10.8%) were homozygous for the thr54 allele. Mean fasting plasma triglyceride levels in patients with the wild- type (OMIM Ref. No. n = 80), those heterozygous for the thr54 allele (OMIM Ref. No. n = 57), and those homozygous for it (OMIM Ref. No. n = 18) were 2.0 +/- 0.09, 2.7 +/- 0.20, and 3.8 +/- 0.43 mmol/L, respectively. A linear relationship of mean fasting plasma triglyceride levels between the 3 groups was found. After fat ingestion, the postpran-

dial area under the curve of plasma triglyceride and chylomicrons was higher in the thr54/thr54 (n = 6) than in the wild- type (n = 9). The authors concluded that their results support the hypothesis that, in type 2 diabetes, increased intestinal input of triglyceride can lead to elevated fasting and postprandial plasma triglycerides. triglyceride.

[28602]

[28603] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28604] Carlsson, M.; Orho- Melander, M.; Hedenbro, J.; Almgren, P.; Groop, L. C. : The T54 allele of the intestinal fatty acid-binding protein 2 is associated with a parental history of stroke. J. Clin. Endocr. Metab. 85: 2801- 2804, 2000. ; and

[28605] Georgopoulos, A.; Aras, O.; Tsai, M. Y. : Codon- 54 polymorphism of the fatty acid- binding protein 2 gene is associated with elevation of fasting and postprandial triglyceride in type 2.

[28606] Further studies establishing the function and utilities of FABP2 are found in John Hopkins OMIM database record ID 134640, and in cited publications listed in Table 5, which are hereby incorporated by reference.Fanconi ane-

mia, complementation group e (FANCE, Accession NP_068741.1) is another GAM189 target gene, herein designated TARGET GENE. FANCE BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FANCE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FANCE BINDING SITE, designated SEQ ID:5597, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28607] Another function of GAM189 is therefore inhibition of Fanconi anemia, complementation group e (FANCE, Accession NP_068741.1), a gene which is a possible regulator of lymphocyte and platelet function. and therefore is associated with Fanconi anemia, complementation group e. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Fanconi anemia, complementation group e., and of other diseases and clinical conditions associated with FANCE.

[28608] The function of FANCE has been established by previous studies. A number sign (#) is used with this entry because Fanconi anemia is caused by mutation in 1 of the Fanconi anemia complementation group genes: FANCA (OMIM Ref.

No. 607139), FANCB (OMIM Ref. No. 227660), FANCC (OMIM Ref. No. 227645), FANCD1 (OMIM Ref. No. 605724), FANCD2 (OMIM Ref. No. 227646), FANCE (OMIM Ref. No. 600901), FANCF (OMIM Ref. No. 603467), FANCG (OMIM Ref. No. 602956). The previously designated FANCH complementation group (Joenje et al., 1997) was found by Joenje et al. (2000) to be the same as FANCA. Joenje et al. (1995) presented evidence for a fifth subtype of Fanconi anemia, designated group E. Buchwald (1995) stated that 6 of 31 patients (12.7%) could be classified as group E. The FACE group is defined as being different from groups A (OMIM Ref. No. 227650), B (OMIM Ref. No. 227660), C (OMIM Ref. No. 227645), and D (OMIM Ref. No. 227646) and may itself be heterogeneous.

[28609]

[28610] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28611] Joenje, H.; Lo Ten Foe, J. R.; Oostra, A. B.; van Berkel, C. G. M.; Rooimans, M. A.; Schroeder- Kurth, T.; Wegner, R.- D.; Gille, J. J. P.; Buchwald, M.; Arwert, F. : Classification of Fanconi anemia patients by complementation analysis: evidence for a fifth genetic subtype. Blood 86: 2156- 2160,

1995. ; and

[28612] Buchwald, M. : Complementation groups: one or more per gene? Nature Genet. 11: 228- 230, 1995.

[28613] Further studies establishing the function and utilities of FANCE are found in John Hopkins OMIM database record ID 600901, and in cited publications listed in Table 5, which are hereby incorporated by reference.Fanconi anemia, complementation group f (FANCF, Accession NP_073562.1) is another GAM189 target gene, herein designated TARGET GENE. FANCF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FANCF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FANCF BINDING SITE, designated SEQ ID:5816, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28614] Another function of GAM189 is therefore inhibition of Fanconi anemia, complementation group f (FANCF, Accession NP_073562.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FANCF.

[28615] FAT3 (Accession XP_061871.5) is another GAM189 target

gene, herein designated TARGET GENE. FAT3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FAT3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FAT3 BINDING SITE, designated SEQ ID:8236, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28616] Another function of GAM189 is therefore inhibition of FAT3 (Accession XP_061871.5) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FAT3.

[28617] FBXW8 (Accession NP_036306.1) is another GAM189 target gene, herein designated TARGET GENE. FBXW8 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FBXW8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FBXW8 BINDING SITE, designated SEQ ID:11845, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ

ID:246.

[28618] Another function of GAM189 is therefore inhibition of FBXW8 (Accession NP_036306.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXW8.

[28619] FBXW8 (Accession NP_699179.2) is another GAM189 target gene, herein designated TARGET GENE. FBXW8 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FBXW8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FBXW8 BINDING SITE, designated SEQ ID:11845, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28620] Another function of GAM189 is therefore inhibition of FBXW8 (Accession NP_699179.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXW8.

[28621] Fc fragment of iga, receptor for (FCAR, Accession NP_579813.1) is another GAM189 target gene, herein designated TARGET GENE. FCAR BINDING SITE1 through

FCAR BINDING SITE3 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by FCAR, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FCAR BINDING SITE1 through FCAR BINDING SITE3, designated SEQ ID:17643, SEQ ID:10448 and SEQ ID:10448 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28622] Another function of GAM189 is therefore inhibition of Fc fragment of iga, receptor for (FCAR, Accession NP_579813.1), a gene which binds to the fc region of immunoglobulins alpha and mediates several functions including cytokine production. and therefore may be associated with Iga nephropathy. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Iga nephropathy., and of other diseases and clinical conditions associated with FCAR.

[28623] The function of FCAR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM136.1.Fc fragment of iga, receptor for (FCAR, Ac-

cession NP_579811.1) is another GAM189 target gene, herein designated TARGET GENE. FCAR BINDING SITE1 through FCAR BINDING SITE3 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by FCAR, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FCAR BINDING SITE1 through FCAR BINDING SITE3, designated SEQ ID:10448, SEQ ID:10448 and SEQ ID:10448 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28624] Another function of GAM189 is therefore inhibition of Fc fragment of iga, receptor for (FCAR, Accession NP_579811.1), a gene which binds to the fc region of immunoglobulins alpha and mediates several functions including cytokine production. and therefore may be associated with Iga nephropathy. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Iga nephropathy., and of other diseases and clinical conditions associated with FCAR.

[28625] The function of FCAR and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to GAM136.1.Fc fragment of iga, receptor for (FCAR, Accession NP_579807.1) is another GAM189 target gene, herein designated TARGET GENE. FCAR BINDING SITE1 through FCAR BINDING SITE3 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by FCAR, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FCAR BINDING SITE1 through FCAR BINDING SITE3, designated SEQ ID:10448, SEQ ID:3819 and SEQ ID:10448 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28626] Another function of GAM189 is therefore inhibition of Fc fragment of iga, receptor for (FCAR, Accession NP_579807.1), a gene which binds to the fc region of immunoglobulins alpha and mediates several functions including cytokine production. and therefore may be associated with Iga nephropathy. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Iga nephropathy., and of other diseases and clinical conditions associated with FCAR.

[28627] The function of FCAR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM136.1.Fc fragment of iga, receptor for (FCAR, Accession NP_579814.1) is another GAM189 target gene, herein designated TARGET GENE. FCAR BINDING SITE1 through FCAR BINDING SITE3 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by FCAR, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FCAR BINDING SITE1 through FCAR BINDING SITE3, designated SEQ ID:17643, SEQ ID:497 and SEQ ID:11291 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28628] Another function of GAM189 is therefore inhibition of Fc fragment of iga, receptor for (FCAR, Accession NP_579814.1), a gene which binds to the fc region of immunoglobulins alpha and mediates several functions including cytokine production. and therefore may be associated with Iga nephropathy. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of

Iga nephropathy., and of other diseases and clinical conditions associated with FCAR.

[28629] The function of FCAR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM136.1.Fer-1-like 4 (c. elegans) (FER1L4, Accession XP_300246.1) is another GAM189 target gene, herein designated TARGET GENE. FER1L4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FER1L4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FER1L4 BINDING SITE, designated SEQ ID:11291, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28630] Another function of GAM189 is therefore inhibition of Fer-1-like 4 (c. elegans) (FER1L4, Accession XP_300246.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FER1L4.

[28631] Fasciculation and elongation protein zeta 1 (zygin i) (FEZ1, Accession NP_072043.1) is another GAM189 target gene,

herein designated TARGET GENE. FEZ1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FEZ1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FEZ1 BINDING SITE, designated SEQ ID:5204, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28632] Another function of GAM189 is therefore inhibition of Fasciculation and elongation protein zeta 1 (zygin i) (FEZ1, Accession NP_072043.1), a gene which Zygin 1; may have a role in axonal outgrowth; has similarity to C. elegans UNC- 76. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FEZ1.

[28633] The function of FEZ1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Fibroblast growth factor 5 (FGF5, Accession NP_004455.1) is another GAM189 target gene, herein designated TARGET GENE. FGF5 BINDING SITE is a target binding site found in the 3` untranslated region of multi-

ple transcripts of mRNA encoded by FGF5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FGF5 BINDING SITE, designated SEQ ID:14382, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28634] Another function of GAM189 is therefore inhibition of Fibroblast growth factor 5 (FGF5, Accession NP_004455.1), a gene which induces transformation and may regulate neuronal differentiation. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF5.

[28635] The function of FGF5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM106.1.Fibroblast growth factor 5 (FGF5, Accession NP_149134.1) is another GAM189 target gene, herein designated TARGET GENE. FGF5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FGF5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the

complementarity of the nucleotide sequences of FGF5 BINDING SITE, designated SEQ ID:14382, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28636] Another function of GAM189 is therefore inhibition of Fibroblast growth factor 5 (FGF5, Accession NP_149134.1), a gene which induces transformation and may regulate neuronal differentiation. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF5.

[28637] The function of FGF5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM106.1.Four and a half lim domains 2 (FHL2, Accession NP_001441.2) is another GAM189 target gene, herein designated TARGET GENE. FHL2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FHL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FHL2 BINDING SITE, designated SEQ ID:16589, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ

ID:246.

[28638] Another function of GAM189 is therefore inhibition of Four and a half lim domains 2 (FHL2, Accession NP_001441.2), a gene which Contains four LIM domains and an additional zinc finger. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FHL2.

[28639] The function of FHL2 has been established by previous studies. LIM proteins contain a highly conserved double zinc finger motif called the LIM domain. By searching sequence databases with a partial human SLIM1 (FHL1; 300163) cDNA, Morgan and Madgwick (1996) identified partial SLIM3 cDNAs. Genini et al. (1997) used subtractive cloning to isolate a gene that is downregulated during transformation of normal myoblasts to rhabdomyosarcoma cells. The gene, termed DRAL for 'down- regulated in rhabdomyosarcoma LIM protein,' encodes a 279- amino acid polypeptide with an observed mass of 32 kD. The protein sequence contains 4 complete LIM domains and the second half of a fifth LIM domain. DRAL appears to be a member of the LIM- only class of proteins, which consist primarily of LIM domains and little else. Southern blotting revealed a single- copy gene that is conserved among

vertebrates. Northern blotting revealed that the DRAL gene is expressed at highest levels in heart and ovary, and at lower levels in skeletal muscle, prostate, testis, small intestine, and colon. Results of Northern blotting of tumor cell lines suggested to Genini et al. (1997) that this gene may be downregulated during transformation of a variety of cell types. Genini et al. (1997) used in situ hybridization to map the human FHL2 gene to 2q12- q14. By fluorescence in situ hybridization, Chan et al. (1998) mapped the FHL2 gene to 2q12- q13. Using the yeast 2- hybrid system, Tanahashi and Tabira (2000) screened for proteins interacting with an Alzheimer disease gene, presenilin- 2 (OMIM Ref. No. 600759), and cloned DRAL. DRAL interacted with a hydrophilic loop region (amino acids 269- 298) in the endoproteolytic N- terminal fragment of PS2, but not that of PS1 (OMIM Ref. No. 104311), although residues 269 to 298 of PS2 and the corresponding PS1 sequence differ by only 3 amino acids. Each of 9 PS2 point mutations within a region from residues 275 to 296 abolished the binding. The in vitro interaction was confirmed by affinity column assay and the physiologic interactions between endogenous PS2 and DRAL by coimmunoprecipitation from human lung fibroblast MRC5 cells. The au-

thors suggested that DRAL functions as a link between PS2 and an intracellular signaling pathway.

[28640]

[28641] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28642] Genini, M.; Schwalbe, P.; Scholl, F. A.; Remppis, A.; Mattei, M.- G.; Schafer, B. W. : Subtractive cloning and characterization of DRAL, a novel LIM- domain protein down- regulated in rhabdomyosarcoma. DNA Cell Biol. 16: 433- 442, 1997. ; and

[28643] Tanahashi, H.; Tabira, T. : Alzheimer's disease- associated presenilin 2 interacts with DRAL, an LIM- domain protein. Hum. Molec. Genet. 9: 2281- 2289, 2000.

[28644] Further studies establishing the function and utilities of FHL2 are found in John Hopkins OMIM database record ID 602633, and in cited publications listed in Table 5, which are hereby incorporated by reference.FISH (Accession NP_055446.1) is another GAM189 target gene, herein designated TARGET GENE. FISH BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FISH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FISH BINDING SITE, designated SEQ ID:13261, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28645] Another function of GAM189 is therefore inhibition of FISH (Accession NP_055446.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FISH.

[28646] Fk506 binding protein 9, 63 kda (FKBP9, Accession NP_009201.1) is another GAM189 target gene, herein designated TARGET GENE. FKBP9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FKBP9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FKBP9 BINDING SITE, designated SEQ ID:7851, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28647] Another function of GAM189 is therefore inhibition of Fk506 binding protein 9, 63 kda (FKBP9, Accession NP_009201.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with FKBP9.

[28648] FLJ00001 (Accession XP_088525.2) is another GAM189 target gene, herein designated TARGET GENE. FLJ00001 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ00001, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ00001 BINDING SITE, designated SEQ ID:14844, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28649] Another function of GAM189 is therefore inhibition of FLJ00001 (Accession XP_088525.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00001.

[28650] FLJ00060 (Accession XP_028154.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ00060 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ00060, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ00060 BINDING SITE, designated SEQ ID:11528, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28651] Another function of GAM189 is therefore inhibition of FLJ00060 (Accession XP_028154.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00060.

[28652] FLJ10101 (Accession NP_078994.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ10101 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10101, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10101 BINDING SITE, designated SEQ ID:9189, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28653] Another function of GAM189 is therefore inhibition of FLJ10101 (Accession NP_078994.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10101.

[28654] FLJ10232 (Accession NP_060503.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ10232 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10232, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10232 BINDING SITE, designated SEQ ID:19236, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28655] Another function of GAM189 is therefore inhibition of FLJ10232 (Accession NP_060503.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10232.

[28656] FLJ10298 (Accession NP_060520.2) is another GAM189 target gene, herein designated TARGET GENE. FLJ10298 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10298, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10298 BINDING SITE, designated SEQ ID:2615, to the

nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28657] Another function of GAM189 is therefore inhibition of FLJ10298 (Accession NP_060520.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10298.

[28658] FLJ10346 (Accession NP_060535.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ10346 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ10346, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10346 BINDING SITE, designated SEQ ID:19219, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28659] Another function of GAM189 is therefore inhibition of FLJ10346 (Accession NP_060535.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10346.

[28660] FLJ10520 (Accession NP_060594.2) is another GAM189

target gene, herein designated TARGET GENE. FLJ10520 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10520, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10520 BINDING SITE, designated SEQ ID:4272, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28661] Another function of GAM189 is therefore inhibition of FLJ10520 (Accession NP_060594.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10520.

[28662] FLJ10535 (Accession NP_060599.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ10535 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10535, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10535 BINDING SITE, designated SEQ ID:9543, to the nucleotide sequence of GAM189 RNA, herein designated

GAM RNA, also designated SEQ ID:246.

[28663] Another function of GAM189 is therefore inhibition of FLJ10535 (Accession NP_060599.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10535.

[28664] FLJ10560 (Accession NP_060608.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ10560 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10560, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10560 BINDING SITE, designated SEQ ID:15591, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28665] Another function of GAM189 is therefore inhibition of FLJ10560 (Accession NP_060608.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10560.

[28666] FLJ10713 (Accession NP_060659.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ10713

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10713, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10713 BINDING SITE, designated SEQ ID:7909, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28667] Another function of GAM189 is therefore inhibition of FLJ10713 (Accession NP_060659.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10713.

[28668] FLJ10846 (Accession NP_060711.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ10846 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10846, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10846 BINDING SITE, designated SEQ ID:11528, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28669] Another function of GAM189 is therefore inhibition of FLJ10846 (Accession NP_060711.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10846.

[28670] FLJ10847 (Accession NP_060712.2) is another GAM189 target gene, herein designated TARGET GENE. FLJ10847 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10847, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10847 BINDING SITE, designated SEQ ID:19357, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28671] Another function of GAM189 is therefore inhibition of FLJ10847 (Accession NP_060712.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10847.

[28672] FLJ10922 (Accession NP_060743.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ10922 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by FLJ10922, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10922 BINDING SITE, designated SEQ ID:18818, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28673] Another function of GAM189 is therefore inhibition of FLJ10922 (Accession NP_060743.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10922.

[28674] FLJ11323 (Accession NP_060860.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ11323 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FLJ11323, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11323 BINDING SITE, designated SEQ ID:2044, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28675] Another function of GAM189 is therefore inhibition of

FLJ11323 (Accession NP_060860.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11323.

[28676] FLJ11467 (Accession NP_079239.2) is another GAM189 target gene, herein designated TARGET GENE. FLJ11467 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11467, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11467 BINDING SITE, designated SEQ ID:834, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28677] Another function of GAM189 is therefore inhibition of FLJ11467 (Accession NP_079239.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11467.

[28678] FLJ11710 (Accession NP_079122.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ11710 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11710, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11710 BINDING SITE, designated SEQ ID:9688, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28679] Another function of GAM189 is therefore inhibition of FLJ11710 (Accession NP_079122.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11710.

[28680] FLJ11715 (Accession NP_078840.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ11715 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11715, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11715 BINDING SITE, designated SEQ ID:3305, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28681] Another function of GAM189 is therefore inhibition of FLJ11715 (Accession NP_078840.1) . Accordingly, utilities

of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11715.

[28682] FLJ11800 (Accession NP_079250.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ11800 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11800, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11800 BINDING SITE, designated SEQ ID:10847, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28683] Another function of GAM189 is therefore inhibition of FLJ11800 (Accession NP_079250.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11800.

[28684] FLJ12076 (Accession NP_079463.2) is another GAM189 target gene, herein designated TARGET GENE. FLJ12076 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12076, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12076 BINDING SITE, designated SEQ ID:8886, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28685] Another function of GAM189 is therefore inhibition of FLJ12076 (Accession NP_079463.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12076.

[28686] FLJ12363 (Accession NP_115543.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ12363 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12363, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12363 BINDING SITE, designated SEQ ID:17722, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28687] Another function of GAM189 is therefore inhibition of FLJ12363 (Accession NP_115543.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ12363.

[28688] FLJ12572 (Accession NP_075056.2) is another GAM189 target gene, herein designated TARGET GENE. FLJ12572 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ12572, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12572 BINDING SITE, designated SEQ ID:17515, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28689] Another function of GAM189 is therefore inhibition of FLJ12572 (Accession NP_075056.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12572.

[28690] FLJ12586 (Accession NP_078896.2) is another GAM189 target gene, herein designated TARGET GENE. FLJ12586 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ12586, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ12586 BINDING SITE, designated SEQ ID:10410, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28691] Another function of GAM189 is therefore inhibition of FLJ12586 (Accession NP_078896.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12586.

[28692] FLJ12649 (Accession XP_291344.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ12649 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12649, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12649 BINDING SITE, designated SEQ ID:3686, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28693] Another function of GAM189 is therefore inhibition of FLJ12649 (Accession XP_291344.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ12649.

[28694] FLJ12687 (Accession NP_079193.2) is another GAM189 target gene, herein designated TARGET GENE. FLJ12687 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12687, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12687 BINDING SITE, designated SEQ ID:3324, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28695] Another function of GAM189 is therefore inhibition of FLJ12687 (Accession NP_079193.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12687.

[28696] FLJ12747 (Accession XP_290972.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ12747 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12747, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ12747 BINDING SITE, designated SEQ ID:10683, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28697] Another function of GAM189 is therefore inhibition of FLJ12747 (Accession XP_290972.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12747.

[28698] FLJ12787 (Accession NP_115551.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ12787 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12787, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12787 BINDING SITE, designated SEQ ID:14839, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28699] Another function of GAM189 is therefore inhibition of FLJ12787 (Accession NP_115551.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12787.

[28700] FLJ12800 (Accession NP_075054.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ12800 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12800, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12800 BINDING SITE, designated SEQ ID:4261, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28701] Another function of GAM189 is therefore inhibition of FLJ12800 (Accession NP_075054.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12800.

[28702] FLJ12888 (Accession NP_079221.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ12888 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12888, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12888 BINDING SITE, designated SEQ ID:17723, to the

nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28703] Another function of GAM189 is therefore inhibition of FLJ12888 (Accession NP_079221.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12888.

[28704] FLJ12903 (Accession NP_073590.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ12903 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12903, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12903 BINDING SITE, designated SEQ ID:10224, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28705] Another function of GAM189 is therefore inhibition of FLJ12903 (Accession NP_073590.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12903.

[28706] FLJ12960 (Accession NP_078914.1) is another GAM189

target gene, herein designated TARGET GENE. FLJ12960 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12960, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12960 BINDING SITE, designated SEQ ID:11523, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28707] Another function of GAM189 is therefore inhibition of FLJ12960 (Accession NP_078914.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12960.

[28708] FLJ12973 (Accession NP_079184.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ12973 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12973, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12973 BINDING SITE, designated SEQ ID:5230, to the nucleotide sequence of GAM189 RNA, herein designated

GAM RNA, also designated SEQ ID:246.

[28709] Another function of GAM189 is therefore inhibition of FLJ12973 (Accession NP_079184.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12973.

[28710] FLJ12975 (Accession NP_079085.2) is another GAM189 target gene, herein designated TARGET GENE. FLJ12975 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12975, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12975 BINDING SITE, designated SEQ ID:2409, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28711] Another function of GAM189 is therefore inhibition of FLJ12975 (Accession NP_079085.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12975.

[28712] FLJ12986 (Accession XP_290685.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ12986

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12986, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12986 BINDING SITE, designated SEQ ID:6037, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28713] Another function of GAM189 is therefore inhibition of FLJ12986 (Accession XP_290685.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12986.

[28714] FLJ13072 (Accession XP_117117.2) is another GAM189 target gene, herein designated TARGET GENE. FLJ13072 BINDING SITE1 and FLJ13072 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ13072, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13072 BINDING SITE1 and FLJ13072 BINDING SITE2, designated SEQ ID:13729 and SEQ ID:2223 respectively, to the nucleotide sequence of

GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28715] Another function of GAM189 is therefore inhibition of FLJ13072 (Accession XP_117117.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13072.

[28716] FLJ13114 (Accession NP_078817.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ13114 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13114, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13114 BINDING SITE, designated SEQ ID:11919, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28717] Another function of GAM189 is therefore inhibition of FLJ13114 (Accession NP_078817.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13114.

[28718] FLJ13197 (Accession NP_078890.1) is another GAM189

target gene, herein designated TARGET GENE. FLJ13197 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13197, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13197 BINDING SITE, designated SEQ ID:8231, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28719] Another function of GAM189 is therefore inhibition of FLJ13197 (Accession NP_078890.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13197.

[28720] FLJ13352 (Accession NP_078868.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ13352 BINDING SITE1 and FLJ13352 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ13352, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13352 BINDING SITE1 and FLJ13352 BINDING SITE2, designated SEQ ID:13318 and

SEQ ID:10493 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28721] Another function of GAM189 is therefore inhibition of FLJ13352 (Accession NP_078868.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13352.

[28722] FLJ13456 (Accession XP_038291.5) is another GAM189 target gene, herein designated TARGET GENE. FLJ13456 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13456, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13456 BINDING SITE, designated SEQ ID:8163, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28723] Another function of GAM189 is therefore inhibition of FLJ13456 (Accession XP_038291.5) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13456.

[28724] FLJ13910 (Accession NP_073617.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ13910 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13910, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13910 BINDING SITE, designated SEQ ID:7691, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28725] Another function of GAM189 is therefore inhibition of FLJ13910 (Accession NP_073617.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13910.

[28726] FLJ13984 (Accession NP_079046.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ13984 BINDING SITE1 and FLJ13984 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ13984, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13984 BINDING SITE1 and

FLJ13984 BINDING SITE2, designated SEQ ID:10809 and SEQ ID:4819 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28727] Another function of GAM189 is therefore inhibition of FLJ13984 (Accession NP_079046.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13984.

[28728] FLJ14100 (Accession NP_079301.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ14100 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14100, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14100 BINDING SITE, designated SEQ ID:12143, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28729] Another function of GAM189 is therefore inhibition of FLJ14100 (Accession NP_079301.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ14100.

[28730] FLJ14260 (Accession NP_079303.2) is another GAM189 target gene, herein designated TARGET GENE. FLJ14260 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14260, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14260 BINDING SITE, designated SEQ ID:921, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28731] Another function of GAM189 is therefore inhibition of FLJ14260 (Accession NP_079303.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14260.

[28732] FLJ14351 (Accession NP_079008.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ14351 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14351, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ14351 BINDING SITE, designated SEQ ID:8586, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28733] Another function of GAM189 is therefore inhibition of FLJ14351 (Accession NP_079008.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14351.

[28734] FLJ14442 (Accession NP_116174.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ14442 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14442, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14442 BINDING SITE, designated SEQ ID:16259, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28735] Another function of GAM189 is therefore inhibition of FLJ14442 (Accession NP_116174.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14442.

[28736] FLJ14803 (Accession NP_116231.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ14803 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14803, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14803 BINDING SITE, designated SEQ ID:939, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28737] Another function of GAM189 is therefore inhibition of FLJ14803 (Accession NP_116231.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14803.

[28738] FLJ14957 (Accession NP_116255.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ14957 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14957, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14957 BINDING SITE, designated SEQ ID:13527, to the

nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28739] Another function of GAM189 is therefore inhibition of FLJ14957 (Accession NP_116255.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14957.

[28740] FLJ20045 (Accession NP_060108.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ20045 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20045, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20045 BINDING SITE, designated SEQ ID:12557, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28741] Another function of GAM189 is therefore inhibition of FLJ20045 (Accession NP_060108.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20045.

[28742] FLJ20070 (Accession NP_060122.1) is another GAM189

target gene, herein designated TARGET GENE. FLJ20070 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20070, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20070 BINDING SITE, designated SEQ ID:7530, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28743] Another function of GAM189 is therefore inhibition of FLJ20070 (Accession NP_060122.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20070.

[28744] FLJ20079 (Accession NP_060126.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ20079 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20079, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20079 BINDING SITE, designated SEQ ID:14265, to the nucleotide sequence of GAM189 RNA, herein designated

GAM RNA, also designated SEQ ID:246.

[28745] Another function of GAM189 is therefore inhibition of FLJ20079 (Accession NP_060126.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20079.

[28746] FLJ20095 (Accession NP_060136.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ20095 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20095, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20095 BINDING SITE, designated SEQ ID:7385, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28747] Another function of GAM189 is therefore inhibition of FLJ20095 (Accession NP_060136.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20095.

[28748] FLJ20136 (Accession NP_060154.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ20136

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20136, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20136 BINDING SITE, designated SEQ ID:4536, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28749] Another function of GAM189 is therefore inhibition of FLJ20136 (Accession NP_060154.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20136.

[28750] FLJ20147 (Accession NP_060157.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ20147 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20147, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20147 BINDING SITE, designated SEQ ID:2624, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28751] Another function of GAM189 is therefore inhibition of FLJ20147 (Accession NP_060157.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20147.

[28752] FLJ20245 (Accession NP_060193.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ20245 BINDING SITE1 and FLJ20245 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ20245, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20245 BINDING SITE1 and FLJ20245 BINDING SITE2, designated SEQ ID:5275 and SEQ ID:8581 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28753] Another function of GAM189 is therefore inhibition of FLJ20245 (Accession NP_060193.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20245.

[28754] FLJ20257 (Accession NP_062552.1) is another GAM189

target gene, herein designated TARGET GENE. FLJ20257 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20257, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20257 BINDING SITE, designated SEQ ID:7206, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28755] Another function of GAM189 is therefore inhibition of FLJ20257 (Accession NP_062552.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20257.

[28756] FLJ20344 (Accession NP_060246.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ20344 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20344, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20344 BINDING SITE, designated SEQ ID:4079, to the nucleotide sequence of GAM189 RNA, herein designated

GAM RNA, also designated SEQ ID:246.

[28757] Another function of GAM189 is therefore inhibition of FLJ20344 (Accession NP_060246.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20344.

[28758] FLJ20359 (Accession NP_060251.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ20359 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20359, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20359 BINDING SITE, designated SEQ ID:11024, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28759] Another function of GAM189 is therefore inhibition of FLJ20359 (Accession NP_060251.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20359.

[28760] FLJ20375 (Accession NP_060264.2) is another GAM189 target gene, herein designated TARGET GENE. FLJ20375

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20375, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20375 BINDING SITE, designated SEQ ID:9357, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28761] Another function of GAM189 is therefore inhibition of FLJ20375 (Accession NP_060264.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20375.

[28762] FLJ20511 (Accession NP_060323.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ20511 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20511, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20511 BINDING SITE, designated SEQ ID:17759, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28763] Another function of GAM189 is therefore inhibition of FLJ20511 (Accession NP_060323.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20511.

[28764] FLJ20527 (Accession NP_060333.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ20527 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ20527, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20527 BINDING SITE, designated SEQ ID:17075, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28765] Another function of GAM189 is therefore inhibition of FLJ20527 (Accession NP_060333.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20527.

[28766] FLJ20671 (Accession NP_060394.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ20671 BINDING SITE1 and FLJ20671 BINDING SITE2 are target

binding sites found in untranslated regions of mRNA encoded by FLJ20671, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20671 BINDING SITE1 and FLJ20671 BINDING SITE2, designated SEQ ID:16491 and SEQ ID:13041 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28767] Another function of GAM189 is therefore inhibition of FLJ20671 (Accession NP_060394.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20671.

[28768] FLJ20700 (Accession NP_060402.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ20700 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20700, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20700 BINDING SITE, designated SEQ ID:18943, to the nucleotide sequence of GAM189 RNA, herein designated

GAM RNA, also designated SEQ ID:246.

[28769] Another function of GAM189 is therefore inhibition of FLJ20700 (Accession NP_060402.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20700.

[28770] FLJ20813 (Accession NP_060431.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ20813 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20813, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20813 BINDING SITE, designated SEQ ID:10574, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28771] Another function of GAM189 is therefore inhibition of FLJ20813 (Accession NP_060431.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20813.

[28772] FLJ21128 (Accession NP_079359.2) is another GAM189 target gene, herein designated TARGET GENE. FLJ21128

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ21128, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21128 BINDING SITE, designated SEQ ID:17516, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28773] Another function of GAM189 is therefore inhibition of FLJ21128 (Accession NP_079359.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21128.

[28774] FLJ21603 (Accession NP_079038.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ21603 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ21603, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21603 BINDING SITE, designated SEQ ID:15047, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28775] Another function of GAM189 is therefore inhibition of FLJ21603 (Accession NP_079038.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21603.

[28776] FLJ21673 (Accession NP_112160.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ21673 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ21673, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21673 BINDING SITE, designated SEQ ID:1435, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28777] Another function of GAM189 is therefore inhibition of FLJ21673 (Accession NP_112160.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21673.

[28778] FLJ21777 (Accession NP_115585.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ21777 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by FLJ21777, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21777 BINDING SITE, designated SEQ ID:4203, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28779] Another function of GAM189 is therefore inhibition of FLJ21777 (Accession NP_115585.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21777.

[28780] FLJ22329 (Accession NP_078932.2) is another GAM189 target gene, herein designated TARGET GENE. FLJ22329 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ22329, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22329 BINDING SITE, designated SEQ ID:9543, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28781] Another function of GAM189 is therefore inhibition of

FLJ22329 (Accession NP_078932.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22329.

[28782] FLJ22531 (Accession NP_078926.2) is another GAM189 target gene, herein designated TARGET GENE. FLJ22531 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ22531, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22531 BINDING SITE, designated SEQ ID:5636, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28783] Another function of GAM189 is therefore inhibition of FLJ22531 (Accession NP_078926.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22531.

[28784] FLJ22794 (Accession NP_071357.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ22794 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ22794, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22794 BINDING SITE, designated SEQ ID:5559, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28785] Another function of GAM189 is therefore inhibition of FLJ22794 (Accession NP_071357.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22794.

[28786] FLJ22965 (Accession NP_071384.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ22965 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ22965, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22965 BINDING SITE, designated SEQ ID:2808, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28787] Another function of GAM189 is therefore inhibition of FLJ22965 (Accession NP_071384.1) . Accordingly, utilities

of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22965.

[28788] FLJ23024 (Accession NP_079212.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ23024 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23024, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23024 BINDING SITE, designated SEQ ID:9682, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28789] Another function of GAM189 is therefore inhibition of FLJ23024 (Accession NP_079212.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23024.

[28790] FLJ23053 (Accession NP_075058.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ23053 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23053, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23053 BINDING SITE, designated SEQ ID:8693, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28791] Another function of GAM189 is therefore inhibition of FLJ23053 (Accession NP_075058.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23053.

[28792] FLJ23186 (Accession NP_078892.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ23186 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23186, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23186 BINDING SITE, designated SEQ ID:1340, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28793] Another function of GAM189 is therefore inhibition of FLJ23186 (Accession NP_078892.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ23186.

[28794] FLJ23263 (Accession NP_079391.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ23263 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ23263, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23263 BINDING SITE, designated SEQ ID:11523, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28795] Another function of GAM189 is therefore inhibition of FLJ23263 (Accession NP_079391.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23263.

[28796] FLJ23356 (Accession NP_115613.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ23356 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23356, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ23356 BINDING SITE, designated SEQ ID:12273, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28797] Another function of GAM189 is therefore inhibition of FLJ23356 (Accession NP_115613.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23356.

[28798] FLJ23392 (Accession NP_079060.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ23392 BINDING SITE1 through FLJ23392 BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by FLJ23392, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23392 BINDING SITE1 through FLJ23392 BINDING SITE3, designated SEQ ID:5554, SEQ ID:9148 and SEQ ID:20052 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28799] Another function of GAM189 is therefore inhibition of FLJ23392 (Accession NP_079060.1) . Accordingly, utilities

of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23392.

[28800] FLJ23416 (Accession NP_115614.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ23416 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23416, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23416 BINDING SITE, designated SEQ ID:2152, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28801] Another function of GAM189 is therefore inhibition of FLJ23416 (Accession NP_115614.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23416.

[28802] FLJ23556 (Accession NP_079156.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ23556 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23556, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23556 BINDING SITE, designated SEQ ID:17969, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28803] Another function of GAM189 is therefore inhibition of FLJ23556 (Accession NP_079156.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23556.

[28804] FLJ23563 (Accession XP_041701.4) is another GAM189 target gene, herein designated TARGET GENE. FLJ23563 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23563, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23563 BINDING SITE, designated SEQ ID:15048, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28805] Another function of GAM189 is therefore inhibition of FLJ23563 (Accession XP_041701.4) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ23563.

[28806] FLJ23867 (Accession NP_689875.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ23867 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23867, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23867 BINDING SITE, designated SEQ ID:1374, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28807] Another function of GAM189 is therefore inhibition of FLJ23867 (Accession NP_689875.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23867.

[28808] FLJ25416 (Accession NP_659455.2) is another GAM189 target gene, herein designated TARGET GENE. FLJ25416 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ25416, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ25416 BINDING SITE, designated SEQ ID:16915, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28809] Another function of GAM189 is therefore inhibition of FLJ25416 (Accession NP_659455.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ25416.

[28810] FLJ25795 (Accession NP_689633.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ25795 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ25795, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ25795 BINDING SITE, designated SEQ ID:934, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28811] Another function of GAM189 is therefore inhibition of FLJ25795 (Accession NP_689633.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ25795.

[28812] FLJ30507 (Accession NP_694555.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ30507 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ30507, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ30507 BINDING SITE, designated SEQ ID:17957, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28813] Another function of GAM189 is therefore inhibition of FLJ30507 (Accession NP_694555.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30507.

[28814] FLJ30532 (Accession NP_653325.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ30532 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ30532, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ30532 BINDING SITE, designated SEQ ID:19834, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28815] Another function of GAM189 is therefore inhibition of FLJ30532 (Accession NP_653325.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30532.

[28816] FLJ31139 (Accession NP_775928.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ31139 BINDING SITE1 through FLJ31139 BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by FLJ31139, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31139 BINDING SITE1 through FLJ31139 BINDING SITE3, designated SEQ ID:18868, SEQ ID:15200 and SEQ ID:3952 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28817] Another function of GAM189 is therefore inhibition of FLJ31139 (Accession NP_775928.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ31139.

[28818] FLJ31153 (Accession NP_653201.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ31153 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ31153, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31153 BINDING SITE, designated SEQ ID:7373, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28819] Another function of GAM189 is therefore inhibition of FLJ31153 (Accession NP_653201.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31153.

[28820] FLJ31166 (Accession NP_694567.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ31166 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ31166, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ31166 BINDING SITE, designated SEQ ID:19301, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28821] Another function of GAM189 is therefore inhibition of FLJ31166 (Accession NP_694567.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31166.

[28822] FLJ31338 (Accession NP_689682.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ31338 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ31338, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31338 BINDING SITE, designated SEQ ID:1672, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28823] Another function of GAM189 is therefore inhibition of FLJ31338 (Accession NP_689682.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ31338.

[28824] FLJ31384 (Accession NP_689685.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ31384 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ31384, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31384 BINDING SITE, designated SEQ ID:14326, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28825] Another function of GAM189 is therefore inhibition of FLJ31384 (Accession NP_689685.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31384.

[28826] FLJ31393 (Accession NP_694569.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ31393 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ31393, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ31393 BINDING SITE, designated SEQ ID:9670, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28827] Another function of GAM189 is therefore inhibition of FLJ31393 (Accession NP_694569.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31393.

[28828] FLJ31401 (Accession NP_689877.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ31401 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ31401, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31401 BINDING SITE, designated SEQ ID:16543, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28829] Another function of GAM189 is therefore inhibition of FLJ31401 (Accession NP_689877.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31401.

[28830] FLJ32096 (Accession NP_776156.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ32096 BINDING SITE1 and FLJ32096 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ32096, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32096 BINDING SITE1 and FLJ32096 BINDING SITE2, designated SEQ ID:1025 and SEQ ID:16043 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28831] Another function of GAM189 is therefore inhibition of FLJ32096 (Accession NP_776156.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32096.

[28832] FLJ32130 (Accession NP_689671.2) is another GAM189 target gene, herein designated TARGET GENE. FLJ32130 BINDING SITE1 through FLJ32130 BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by FLJ32130, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32130 BINDING SITE1 through FLJ32130 BINDING SITE3, designated SEQ ID:4630, SEQ ID:15049 and SEQ ID:2061 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28833] Another function of GAM189 is therefore inhibition of FLJ32130 (Accession NP_689671.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32130.

[28834] FLJ32206 (Accession NP_689710.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ32206 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32206, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32206 BINDING SITE, designated SEQ ID:3860, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28835] Another function of GAM189 is therefore inhibition of FLJ32206 (Accession NP_689710.1) . Accordingly, utilities

of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32206.

[28836] FLJ32334 (Accession NP_653166.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ32334 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32334, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32334 BINDING SITE, designated SEQ ID:8493, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28837] Another function of GAM189 is therefore inhibition of FLJ32334 (Accession NP_653166.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32334.

[28838] FLJ32499 (Accession NP_653208.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ32499 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32499, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32499 BINDING SITE, designated SEQ ID:4681, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28839] Another function of GAM189 is therefore inhibition of FLJ32499 (Accession NP_653208.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32499.

[28840] FLJ32731 (Accession NP_689632.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ32731 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32731, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32731 BINDING SITE, designated SEQ ID:16099, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28841] Another function of GAM189 is therefore inhibition of FLJ32731 (Accession NP_689632.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ32731.

[28842] FLJ32803 (Accession NP_694584.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ32803 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32803, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32803 BINDING SITE, designated SEQ ID:1856, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28843] Another function of GAM189 is therefore inhibition of FLJ32803 (Accession NP_694584.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32803.

[28844] FLJ32865 (Accession NP_653214.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ32865 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32865, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ32865 BINDING SITE, designated SEQ ID:2146, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28845] Another function of GAM189 is therefore inhibition of FLJ32865 (Accession NP_653214.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32865.

[28846] FLJ32894 (Accession NP_653268.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ32894 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32894, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32894 BINDING SITE, designated SEQ ID:7467, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28847] Another function of GAM189 is therefore inhibition of FLJ32894 (Accession NP_653268.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ32894.

[28848] FLJ32932 (Accession NP_690873.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ32932 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32932, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32932 BINDING SITE, designated SEQ ID:9555, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28849] Another function of GAM189 is therefore inhibition of FLJ32932 (Accession NP_690873.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32932.

[28850] FLJ33505 (Accession NP_689530.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ33505 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ33505, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ33505 BINDING SITE, designated SEQ ID:13693, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28851] Another function of GAM189 is therefore inhibition of FLJ33505 (Accession NP_689530.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ33505.

[28852] FLJ33655 (Accession NP_775912.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ33655 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ33655, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ33655 BINDING SITE, designated SEQ ID:16113, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28853] Another function of GAM189 is therefore inhibition of FLJ33655 (Accession NP_775912.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ33655.

[28854] FLJ34817 (Accession NP_689516.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ34817 BINDING SITE1 and FLJ34817 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ34817, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ34817 BINDING SITE1 and FLJ34817 BINDING SITE2, designated SEQ ID:4004 and SEQ ID:7075 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28855] Another function of GAM189 is therefore inhibition of FLJ34817 (Accession NP_689516.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ34817.

[28856] FLJ34922 (Accession NP_689483.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ34922 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ34922, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ34922 BINDING SITE, designated SEQ ID:18132, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28857] Another function of GAM189 is therefore inhibition of FLJ34922 (Accession NP_689483.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ34922.

[28858] FLJ34969 (Accession XP_114353.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ34969 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ34969, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ34969 BINDING SITE, designated SEQ ID:581, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28859] Another function of GAM189 is therefore inhibition of FLJ34969 (Accession XP_114353.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ34969.

[28860] FLJ35105 (Accession NP_689890.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ35105 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ35105, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ35105 BINDING SITE, designated SEQ ID:18938, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28861] Another function of GAM189 is therefore inhibition of FLJ35105 (Accession NP_689890.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ35105.

[28862] FLJ35681 (Accession NP_787096.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ35681 BINDING SITE1 and FLJ35681 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ35681, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of FLJ35681 BINDING SITE1 and FLJ35681 BINDING SITE2, designated SEQ ID:1653 and SEQ ID:11521 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28863] Another function of GAM189 is therefore inhibition of FLJ35681 (Accession NP_787096.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ35681.

[28864] FLJ35848 (Accession XP_290755.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ35848 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ35848, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ35848 BINDING SITE, designated SEQ ID:14986, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28865] Another function of GAM189 is therefore inhibition of FLJ35848 (Accession XP_290755.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ35848.

[28866] FLJ36445 (Accession NP_694965.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ36445 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ36445, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ36445 BINDING SITE, designated SEQ ID:2147, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28867] Another function of GAM189 is therefore inhibition of FLJ36445 (Accession NP_694965.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ36445.

[28868] FLJ37045 (Accession NP_787085.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ37045 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ37045, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ37045 BINDING SITE, designated SEQ ID:9497, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28869] Another function of GAM189 is therefore inhibition of FLJ37045 (Accession NP_787085.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ37045.

[28870] FLJ37078 (Accession NP_694588.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ37078 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ37078, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ37078 BINDING SITE, designated SEQ ID:11528, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28871] Another function of GAM189 is therefore inhibition of FLJ37078 (Accession NP_694588.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ37078.

[28872] FLJ37433 (Accession NP_848612.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ37433 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ37433, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ37433 BINDING SITE, designated SEQ ID:8582, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28873] Another function of GAM189 is therefore inhibition of FLJ37433 (Accession NP_848612.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ37433.

[28874] FLJ37543 (Accession NP_775938.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ37543 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ37543, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ37543 BINDING SITE, designated SEQ ID:5495, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28875] Another function of GAM189 is therefore inhibition of FLJ37543 (Accession NP_775938.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ37543.

[28876] FLJ38101 (Accession NP_694993.2) is another GAM189 target gene, herein designated TARGET GENE. FLJ38101 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ38101, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ38101 BINDING SITE, designated SEQ ID:5589, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28877] Another function of GAM189 is therefore inhibition of FLJ38101 (Accession NP_694993.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ38101.

[28878] FLJ38149 (Accession XP_091919.5) is another GAM189 target gene, herein designated TARGET GENE. FLJ38149 BINDING SITE1 through FLJ38149 BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by FLJ38149, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ38149 BINDING SITE1 through FLJ38149 BINDING SITE3, designated SEQ ID:18971, SEQ ID:9373 and SEQ ID:15044 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28879] Another function of GAM189 is therefore inhibition of FLJ38149 (Accession XP_091919.5) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ38149.

[28880] FLJ38281 (Accession NP_689814.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ38281 BINDING SITE1 and FLJ38281 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ38281, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ38281 BINDING SITE1 and FLJ38281 BINDING SITE2, designated SEQ ID:6885 and SEQ ID:9492 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28881] Another function of GAM189 is therefore inhibition of FLJ38281 (Accession NP_689814.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ38281.

[28882] FLJ38607 (Accession NP_689867.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ38607 BINDING SITE1 and FLJ38607 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ38607, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ38607 BINDING SITE1 and FLJ38607 BINDING SITE2, designated SEQ ID:16688 and SEQ ID:7382 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28883] Another function of GAM189 is therefore inhibition of FLJ38607 (Accession NP_689867.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ38607.

[28884] FLJ38792 (Accession NP_848615.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ38792 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ38792, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ38792 BINDING SITE, designated SEQ ID:14861, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28885] Another function of GAM189 is therefore inhibition of FLJ38792 (Accession NP_848615.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ38792.

[28886] FLJ38819 (Accession NP_665872.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ38819 BINDING SITE1 and FLJ38819 BINDING SITE2 are target

binding sites found in untranslated regions of mRNA encoded by FLJ38819, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ38819 BINDING SITE1 and FLJ38819 BINDING SITE2, designated SEQ ID:18642 and SEQ ID:9791 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28887] Another function of GAM189 is therefore inhibition of FLJ38819 (Accession NP_665872.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ38819.

[28888] FLJ38991 (Accession NP_776188.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ38991 BINDING SITE1 and FLJ38991 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ38991, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ38991 BINDING SITE1 and FLJ38991 BINDING SITE2, designated SEQ ID:10356 and

SEQ ID:14236 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28889] Another function of GAM189 is therefore inhibition of FLJ38991 (Accession NP_776188.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ38991.

[28890] FLJ39415 (Accession NP_775952.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ39415 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ39415, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ39415 BINDING SITE, designated SEQ ID:11673, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28891] Another function of GAM189 is therefore inhibition of FLJ39415 (Accession NP_775952.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ39415.

[28892] FLJ39599 (Accession NP_776164.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ39599 BINDING SITE1 and FLJ39599 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ39599, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ39599 BINDING SITE1 and FLJ39599 BINDING SITE2, designated SEQ ID:16001 and SEQ ID:8232 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28893] Another function of GAM189 is therefore inhibition of FLJ39599 (Accession NP_776164.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ39599.

[28894] FLJ39639 (Accession XP_290687.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ39639 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ39639, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ39639 BINDING SITE, designated SEQ ID:9190, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28895] Another function of GAM189 is therefore inhibition of FLJ39639 (Accession XP_290687.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ39639.

[28896] FLJ90231 (Accession NP_775852.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ90231 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ90231, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ90231 BINDING SITE, designated SEQ ID:10357, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28897] Another function of GAM189 is therefore inhibition of FLJ90231 (Accession NP_775852.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ90231.

[28898] FLJ90723 (Accession NP_787115.1) is another GAM189 target gene, herein designated TARGET GENE. FLJ90723 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ90723, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ90723 BINDING SITE, designated SEQ ID:19889, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28899] Another function of GAM189 is therefore inhibition of FLJ90723 (Accession NP_787115.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ90723.

[28900] Formin binding protein 1 (FNBP1, Accession XP_052666.3) is another GAM189 target gene, herein designated TARGET GENE. FNBP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FNBP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of FNBP1 BINDING SITE, designated SEQ ID:16354, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28901] Another function of GAM189 is therefore inhibition of Formin binding protein 1 (FNBP1, Accession XP_052666.3) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FNBP1.

[28902] Forkhead box e2 (FOXE2, Accession NP_036317.1) is another GAM189 target gene, herein designated TARGET GENE. FOXE2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FOXE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FOXE2 BINDING SITE, designated SEQ ID:15626, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28903] Another function of GAM189 is therefore inhibition of Forkhead box e2 (FOXE2, Accession NP_036317.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions as-

sociated with FOXE2.

[28904] Forkhead box o1a (rhabdomyosarcoma) (FOXO1A, Accession NP_002006.2) is another GAM189 target gene, herein designated TARGET GENE. FOXO1A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FOXO1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FOXO1A BINDING SITE, designated SEQ ID:736, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28905] Another function of GAM189 is therefore inhibition of Forkhead box o1a (rhabdomyosarcoma) (FOXO1A, Accession NP_002006.2), a gene which is a probable transcription factor. and therefore may be associated with Alveolar rhabdomyosarcoma- 2. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Alveolar rhabdomyosarcoma- 2., and of other diseases and clinical conditions associated with FOXO1A.

[28906] The function of FOXO1A has been established by previous studies. In alveolar rhabdomyosarcoma, the translocation t(2;13)(q35;q14) is frequently found. Barr et al. (1993) de-

termined that PAX3 (OMIM Ref. No. 606597), which had previously been found to be mutated in Waardenburg syndrome (OMIM Ref. No. 193500), was affected by this t(2;13) in alveolar rhabdomyosarcoma (OMIM Ref. No. 268220). Galili et al. (1993) isolated the chromosome 13 gene that is fused with PAX3. The rearrangement breakpoints occurred within an intron downstream of the paired box and homeodomain- encoding regions. and identified it as a member of the forkhead domain family, which encodes transcription factors containing a conserved DNA-binding motif related to the Drosophila region- specific homeotic gene 'forkhead.' The distal half of the forkhead and the C- terminal region of the FKHR gene are involved in the chimeric transcript and fusion protein. (Because of the homology to 'forkhead,' the gene was symbolized FKHR, for 'forkhead' in rhabdomyosarcoma.) See human T- cell leukemia virus enhancer factor (OMIM Ref. No. 143089) and interleukin enhancer binding factor (OMIM Ref. No. 147685) for other members of the forkhead domain family of transcription factors. Fredericks et al. (1995) demonstrated expression of a 97- kD PAX3/FKHR fusion protein in a t(2;13)- positive rhabdomyosarcoma cell line and verified that a single polypeptide contained

epitopes derived from each protein. The fusion protein was localized to the nucleus in these cells, as was wildtype PAX3 in cells lacking the translocation. They found that DNA binding of the fusion protein was significantly impaired relative to that of PAX3 despite the fact that the 2 proteins had identical PAX DNA- binding domains. However, the fusion protein was a much more potent transcriptional activator than PAX3. Thus, the fusion protein may function as an oncogenic transcription factor by enhancing activation of normal PAX3 target genes.

[28907]

[28908] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28909] Barr, F. G.; Galili, N.; Holick, J.; Biegel, J. A.; Rovera, G.; Emanuel, B. S. : Rearrangement of the PAX3 paired box gene in the paediatric solid tumor alveolar rhabdomyosarcoma. Nature Genet. 3: 113- 117, 1993. ; and

[28910] Fredericks, W. J.; Galili, N.; Mukhopadhyay, S.; Rovera, G.; Bennicelli, J.; Barr, F. G.; Rauscher, F. J., III : The PAX3-FKHR fusion protein created by the t(2;13) translocation in alve.

[28911] Further studies establishing the function and utilities of

FOXO1A are found in John Hopkins OMIM database record ID 136533, and in cited publications listed in Table 5, which are hereby incorporated by reference.Fsh primary response (Irpr1 homolog, rat) 1 (FSHPRH1, Accession NP_006724.1) is another GAM189 target gene, herein designated TARGET GENE. FSHPRH1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FSHPRH1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FSHPRH1 BINDING SITE, designated SEQ ID:11528, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28912] Another function of GAM189 is therefore inhibition of Fsh primary response (Irpr1 homolog, rat) 1 (FSHPRH1, Accession NP_006724.1), a gene which is involved in the response of gonadal tissues to follicle- stimulating hormone. and therefore may be associated with Hypergonadotropic ovarian dysgenesis (odg), x- linked disorders of gonadal development. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Hypergonadotropic ovarian dysgenesis (odg), x- linked disorders

of gonadal development, and of other diseases and clinical conditions associated with FSHPRH1.

[28913] The function of FSHPRH1 has been established by previous studies. Follicle- stimulating hormone (FSH; 136530), a gonadotropic hormone secreted by both the male and the female mammalian anterior pituitary gland, is responsible, with luteinizing hormone (OMIM Ref. No. 152780), for the regulation of follicular maturation and ovulation in females. Loss- of- function mutations in the FSH receptor gene (OMIM Ref. No. 136435) are associated with hypergonadotropic ovarian dysgenesis (ODG) in which inability of the gonads to respond to FSH results in failure of ovarian development with consequent primary amenorrhea; lack of negative feedback to the pituitary leads to the observed high levels of gonadotropins. Mutation of the gene for the beta subunit of FSH (136530.0001) has also been described in a patient with primary amenorrhea who was able to conceive after administration of FSH. Although there may be a role for FSH also in male gonadal development at puberty, fertility appears not to be compromised in known homozygous male relatives of ODG females (Aittomaki et al., 1995). Roberts et al. (1996) hypothesized that mutations in genes encoding other components

of the FSH signaling pathway might be responsible for other cases of female or even male disorders of gonadal development. The rat gene called leucine- rich primary response gene 1 (LRPR1) is rapidly transcriptionally activated in response to FSH stimulation of rat testicular Sertoli cells, both in vitro and in vivo (Slegtenhorst- Eegdeman et al., 1995). Roberts et al. (1996) characterized a human transcript that probably encodes the ortholog of the rat protein. The gene encodes a 756- amino acid polypeptide with 72% identity to rat LRPR1 at the amino acid level. The gene maps to human chromosome Xq22 and therefore is a potential candidate for human X- linked disorders of gonadal development. The human LRPR1 gene (also symbolized FSHPRH1) was isolated during characterization of a gene encoding dystrophin- related protein 2 (DRP2; 300052); searches of sequence databases using the BLAST program revealed the similarities to rat LRPR1. Other evidence indicated that LRPR1 and DRP2, which maps to Xq22, are closely situated. Roberts et al. (1996) found by hybridization to YACs and to cosmids isolated from that region that LRPR1 is transcribed in a proximal- to- distal direction and lies approximately 40 kb proximal to DRP2, while BTK (OMIM Ref. No. 300300),

the gene that is mutant and X- linked agammaglobuline-mia, lies approximately 300 kb distal.

[28914]

[28915] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28916] Aittomaki, K.; Lucena, J. L. D.; Pakarinen, P.; Sistonen, P.; Tapanainen, J.; Gromoll, J.; Kaskikari, R.; Sankila, E.- M.; Lehvaslaiho, H.; Engel, A. R.; Nieschlag, E.; Huhtaniemi, I.; de la Chapelle, A. : Mutation in the follicle- stimulating hormone receptor gene causes hereditary hyperg-onadotropic ovarian failure. Cell 82: 959- 968, 1995. ; and

[28917] Roberts, R. G.; Kendall, E.; Vetrie, D.; Bobrow, M. : Se-quence and chromosomal location of a human homologue of LRPR1, an FSH primary response gene. Genomics 37: 122- 124, 1996.

[28918] Further studies establishing the function and utilities of FSHPRH1 are found in John Hopkins OMIM database record ID 300065, and in cited publications listed in Table 5, which are hereby incorporated by refer-ence.Fucosyltransferase 1 (galactoside 2-alpha-l-fucosyltransferase, bombay phenotype in-

cluded) (FUT1, Accession NP_000139.1) is another GAM189 target gene, herein designated TARGET GENE. FUT1 BINDING SITE1 and FUT1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FUT1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FUT1 BINDING SITE1 and FUT1 BINDING SITE2, designated SEQ ID:16365 and SEQ ID:11525 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28919] Another function of GAM189 is therefore inhibition of Fucosyltransferase 1 (galactoside 2-alpha-l-fucosyltransferase, bombay phenotype included) (FUT1, Accession NP_000139.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUT1.

[28920] Frizzled homolog 4 (drosophila) (FZD4, Accession NP_036325.2) is another GAM189 target gene, herein designated TARGET GENE. FZD4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by FZD4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FZD4 BINDING SITE, designated SEQ ID:4487, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28921] Another function of GAM189 is therefore inhibition of Frizzled homolog 4 (drosophila) (FZD4, Accession NP_036325.2), a gene which may function in cell polarity, cell fate specification and cancer; similar to frizzled receptor family, has seven transmembrane domains and therefore may be associated with Familial exudative vitreoretinopathy. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Familial exudative vitreoretinopathy., and of other diseases and clinical conditions associated with FZD4.

[28922] The function of FZD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM67.1.G2A (Accession NP_037477.1) is another GAM189 target gene, herein designated TARGET GENE. G2A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by G2A, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of G2A BINDING SITE, designated SEQ ID:8714, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28923] Another function of GAM189 is therefore inhibition of G2A (Accession NP_037477.1), a gene which may mediate some of the effects of extracellular atp on insulin secretion. and therefore may be associated with Autoimmune disease. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Autoimmune disease., and of other diseases and clinical conditions associated with G2A.

[28924] The function of G2A has been established by previous studies. G2A belongs to a subfamily of GPCRs that bind to various glycolipids. Kabarowski et al. (2001) determined that expression of G2A induces signaling responses after exposure to lysophosphatidylcholine (LPC) and to sphingosylphosphorylcholine (SPC), a high- affinity ligand for OGR1 (GPR68; 601404). Scatchard analysis indicated that G2A binds LPC with high affinity and SPC with low affinity. Western blot analysis showed that both LPC and SPC acti-

vated ERK mitogen- activated protein kinase (see OMIM Ref. No. MAP3K4; 602425) in G2A- expressing CHO cells. LPC, but not SPC, stimulated transmigration of G2A- expressing T lymphocytes. The authors proposed that G2A may act as a sensor of LPC levels at sites of inflammation to limit the expansion of tissue- infiltrating cells promoting overt autoimmune disease.

[28925] Animal model experiments lend further support to the function of G2A. Le et al. (2001) showed that mice with a targeted disruption of G2a, apart from enhanced in vitro T- cell proliferative responses, initially appeared normal. With age, however, they developed a progressive secondary lymphoid organ enlargement associated with an abnormal polyclonal lymphocyte expansion. Older animals succumbed to a late- onset autoimmune wasting syndrome

[28926] It is appreciated that the abovementioned animal model for G2A is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[28927] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28928] Kabarowski, J. H. S.; Zhu, K.; Le, L. Q.; Witte, O. N.; Xu, Y. : Lysophosphatidylcholine as a ligand for the immunoregulatory receptor G2A. Science 293: 702- 705, 2001. ; and

[28929] Le, L. Q.; Kabarowski, J. H. S.; Weng, Z.; Satterthwaite, A. B.; Harvill, E. T.; Jensen, E. R.; Miller, J. F.; Witte, O. N. : Mice lacking the orphan G protein- coupled receptor G2A de.

[28930] Further studies establishing the function and utilities of G2A are found in John Hopkins OMIM database record ID 606167, and in cited publications listed in Table 5, which are hereby incorporated by reference.Glucose-6-phosphatase, catalytic (glycogen storage disease type i, von gierke disease) (G6PC, Accession NP_000142.1) is another GAM189 target gene, herein designated TARGET GENE. G6PC BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by G6PC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of G6PC BINDING SITE, designated SEQ ID:4204, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28931] Another function of GAM189 is therefore inhibition of

Glucose-6-phosphatase, catalytic (glycogen storage disease type i, von gierke disease) (G6PC, Accession NP_000142.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with G6PC.

[28932] GAL3ST-4 (Accession NP_078913.3) is another GAM189 target gene, herein designated TARGET GENE. GAL3ST-4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GAL3ST-4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GAL3ST-4 BINDING SITE, designated SEQ ID:4518, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28933] Another function of GAM189 is therefore inhibition of GAL3ST-4 (Accession NP_078913.3) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAL3ST-4.

[28934] Gata binding protein 2 (GATA2, Accession NP_116027.2) is another GAM189 target gene, herein designated TARGET GENE. GATA2 BINDING SITE is a target binding site

found in the 3` untranslated region of mRNA encoded by GATA2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GATA2 BINDING SITE, designated SEQ ID:16014, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28935] Another function of GAM189 is therefore inhibition of Gata binding protein 2 (GATA2, Accession NP_116027.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GATA2.

[28936] Golgi associated, gamma adaptin ear containing, arf binding protein 2 (GGA2, Accession NP_619581.1) is another GAM189 target gene, herein designated TARGET GENE. GGA2 BINDING SITE1 and GGA2 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by GGA2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GGA2 BINDING SITE1 and GGA2 BINDING SITE2, designated SEQ

ID:5631 and SEQ ID:5631 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28937] Another function of GAM189 is therefore inhibition of Golgi associated, gamma adaptin ear containing, arf binding protein 2 (GGA2, Accession NP_619581.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGA2.

[28938] Golgi associated, gamma adaptin ear containing, arf binding protein 2 (GGA2, Accession NP_055859.1) is another GAM189 target gene, herein designated TARGET GENE. GGA2 BINDING SITE1 and GGA2 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by GGA2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GGA2 BINDING SITE1 and GGA2 BINDING SITE2, designated SEQ ID:6391 and SEQ ID:6391 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28939] Another function of GAM189 is therefore inhibition of

Golgi associated, gamma adaptin ear containing, arf binding protein 2 (GGA2, Accession NP_055859.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGA2.

[28940] Gm2 ganglioside activator protein (GM2A, Accession NP_000396.1) is another GAM189 target gene, herein designated TARGET GENE. GM2A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GM2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GM2A BINDING SITE, designated SEQ ID:11286, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28941] Another function of GAM189 is therefore inhibition of Gm2 ganglioside activator protein (GM2A, Accession NP_000396.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GM2A.

[28942] GNE (Accession NP_005467.1) is another GAM189 target gene, herein designated TARGET GENE. GNE BINDING SITE

is a target binding site found in the 3` untranslated region of mRNA encoded by GNE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GNE BINDING SITE, designated SEQ ID:8367, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28943] Another function of GAM189 is therefore inhibition of GNE (Accession NP_005467.1), a gene which has roles in sialic acid biosynthesis and regulates cell surface sialylation. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNE.

[28944] The function of GNE has been established by previous studies. Keppler et al. (1999) determined that UDP- GlcNAc 2- epimerase activity is rate- limiting for the biosynthesis of sialic acid and is required for sialylation in hematopoietic cells. The activity of the enzyme can be controlled at the transcriptional level and can affect the sialylation and function of specific cell surface molecules expressed on B cells and myeloid cells. In a Genbank submission (AJ238764), these authors reported the sequence

of a human UDP- GlcNAc 2- epimerase cDNA.

[28945] Animal model experiments lend further support to the function of GNE. Schwarzkopf et al. (2002) reported that inactivation of GNE (which is bifunctional and is the key enzyme of sialic acid biosynthesis) by gene targeting in mice caused early embryonic lethality, thereby emphasizing the fundamental role of the enzyme and sialylation during development. The need of the enzyme for a defined sialylation process is exemplified by the polysialylation of the neural cell adhesion molecule in embyronic stem cells.

[28946] It is appreciated that the abovementioned animal model for GNE is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[28947] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28948] Keppler, O. T.; Hinderlich, S.; Langner, J.; Schwartz- Albiez, R.; Reutter, W.; Pawlita, M. : UDP- GlcNAc 2- epimerase: a regulator of cell surface sialylation. Science 284: 1372- 1376, 1999. ; and

[28949] Schwarzkopf, M.; Knobeloch, K.- P.; Rohde, E.; Hinderlich,

S.; Wiechens, N.; Lucka, L.; Horak, I.; Reutter, W.; Horstkorte, R. : Sialylation is essential for early development in mice.

[28950] Further studies establishing the function and utilities of GNE are found in John Hopkins OMIM database record ID 603824, and in cited publications listed in Table 5, which are hereby incorporated by reference.Guanine nucleotide binding protein (g protein), gamma 4 (GNG4, Accession NP_004476.1) is another GAM189 target gene, herein designated TARGET GENE. GNG4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GNG4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GNG4 BINDING SITE, designated SEQ ID:559, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28951] Another function of GAM189 is therefore inhibition of Guanine nucleotide binding protein (g protein), gamma 4 (GNG4, Accession NP_004476.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNG4.

[28952] GNPNAT1 (Accession XP_085119.1) is another GAM189

target gene, herein designated TARGET GENE. GNPNAT1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GNPNAT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GNPNAT1 BINDING SITE, designated SEQ ID:8464, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28953] Another function of GAM189 is therefore inhibition of GNPNAT1 (Accession XP_085119.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNPNAT1.

[28954] GNRPX (Accession NP_060519.1) is another GAM189 target gene, herein designated TARGET GENE. GNRPX BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GNRPX, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GNRPX BINDING SITE, designated SEQ ID:12243, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA,

also designated SEQ ID:246.

[28955] Another function of GAM189 is therefore inhibition of GNRPX (Accession NP_060519.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNRPX.

[28956] Golgi autoantigen, golgin subfamily a, 3 (GOLGA3, Accession NP_005886.2) is another GAM189 target gene, herein designated TARGET GENE. GOLGA3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GOLGA3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GOLGA3 BINDING SITE, designated SEQ ID:15049, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28957] Another function of GAM189 is therefore inhibition of Golgi autoantigen, golgin subfamily a, 3 (GOLGA3, Accession NP_005886.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLGA3.

[28958] Glycoprotein v (platelet) (GP5, Accession NP_004479.1) is another GAM189 target gene, herein designated TARGET

GENE. GP5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GP5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GP5 BINDING SITE, designated SEQ ID:5681, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28959] Another function of GAM189 is therefore inhibition of Glycoprotein v (platelet) (GP5, Accession NP_004479.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GP5.

[28960] GPP34R (Accession NP_060648.2) is another GAM189 target gene, herein designated TARGET GENE. GPP34R BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPP34R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPP34R BINDING SITE, designated SEQ ID:14203, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28961] Another function of GAM189 is therefore inhibition of GPP34R (Accession NP_060648.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPP34R.

[28962] G protein-coupled receptor 26 (GPR26, Accession NP_703143.1) is another GAM189 target gene, herein designated TARGET GENE. GPR26 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPR26, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPR26 BINDING SITE, designated SEQ ID:3010, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28963] Another function of GAM189 is therefore inhibition of G protein-coupled receptor 26 (GPR26, Accession NP_703143.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR26.

[28964] G protein-coupled receptor 4 (GPR4, Accession NP_005273.1) is another GAM189 target gene, herein designated TARGET GENE. GPR4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by GPR4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPR4 BINDING SITE, designated SEQ ID:4965, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28965] Another function of GAM189 is therefore inhibition of G protein-coupled receptor 4 (GPR4, Accession NP_005273.1), a gene which stimulates to produce increased calcium by both SPC and LPC . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR4.

[28966] The function of GPR4 has been established by previous studies. Many cell membrane receptors are members of the G protein- coupled receptor (GPR) family. GPRs are characterized by the presence of 7 transmembrane domains and numerous conserved amino acids. Using degenerate PCR, Heiber et al. (1995) identified additional members of this family. Among these was GPR4, which encodes a putative 355- amino acid protein and was selected from a genomic DNA library using the PCR- derived product as a probe. GPR4 shares the greatest sequence

similarity with the human platelet- activating factor receptor (Ye et al., 1991). GPR4 is more than 50% identical to OGR1 (GPR68; 601404), a high- affinity receptor for the sphingosylphosphorylcholine (SPC) signaling molecule. Zhu et al. (2001) showed that cells expressing GPR4 are stimulated to produce increased calcium by both SPC and LPC (lysophosphatidylcholine), a ligand for G2A (OMIM Ref. No. 606167). RNA dot blot analysis revealed highest expression of GPR4 in ovary, liver, lung, kidney, lymph node, and subthalamic nucleus; in contrast, OGR1 is most highly expressed in lung, placenta, spleen, testis, small intestine, and peripheral blood leukocytes. Binding analysis determined that GPR4 interacts with SPC with high affinity and with LPC with lower affinity. Both ligands enhanced proliferation and ERK mitogen- activated protein kinase (see OMIM Ref. No. MAP3K4; 602425) activation in a GPR4- dependent and pertussis toxin (PTX)- sensitive manner, whereas ERK activation is PTX- insensitive in OGR1- mediated signaling. Cell migration analysis suggested that both LPC and SPC enhance chemotaxis, but not chemokinesis, through GPR4.

[28967]

[28968] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[28969] Heiber, M.; Docherty, J. M.; Shah, G.; Nguyen, T.; Cheng, R.; Heng, H. H. Q.; Marchese, A.; Tsui, L.- C.; Shi, X.; George, S. R.; O'Dowd, B. F. : Isolation of three novel human genes encoding G protein- coupled receptors. DNA Cell Biol. 14: 25- 35, 1995. ; and

[28970] Zhu, K.; Baudhuin, L. M.; Hong, G.; Williams, F. S.; Cristina, K. L.; Kabarowski, J. H. S.; Witte, O. N.; Xu, Y. : Sphingosylphosphorylcholine and lysophosphatidylcholine are ligands f.

[28971] Further studies establishing the function and utilities of GPR4 are found in John Hopkins OMIM database record ID 600551, and in cited publications listed in Table 5, which are hereby incorporated by reference.G protein-coupled receptor 56 (GPR56, Accession NP_005673.2) is another GAM189 target gene, herein designated TARGET GENE. GPR56 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GPR56, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPR56 BINDING SITE, designated SEQ ID:8622, to the

nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28972] Another function of GAM189 is therefore inhibition of G protein-coupled receptor 56 (GPR56, Accession NP_005673.2), a gene which transduces extracellular signals through heterotrimeric G proteins. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR56.

[28973] The function of GPR56 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.G protein-coupled receptor 66 (GPR66, Accession NP_006047.2) is another GAM189 target gene, herein designated TARGET GENE. GPR66 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPR66, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPR66 BINDING SITE, designated SEQ ID:19237, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28974] Another function of GAM189 is therefore inhibition of G protein-coupled receptor 66 (GPR66, Accession NP_006047.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR66.

[28975] G protein-coupled receptor 81 (GPR81, Accession NP_115943.1) is another GAM189 target gene, herein designated TARGET GENE. GPR81 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPR81, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPR81 BINDING SITE, designated SEQ ID:13260, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28976] Another function of GAM189 is therefore inhibition of G protein-coupled receptor 81 (GPR81, Accession NP_115943.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR81.

[28977] GR6 (Accession NP_031380.1) is another GAM189 target gene, herein designated TARGET GENE. GR6 BINDING SITE

is a target binding site found in the 5` untranslated region of mRNA encoded by GR6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GR6 BINDING SITE, designated SEQ ID:2604, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28978] Another function of GAM189 is therefore inhibition of GR6 (Accession NP_031380.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GR6.

[28979] GRAF (Accession NP_055886.1) is another GAM189 target gene, herein designated TARGET GENE. GRAF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GRAF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GRAF BINDING SITE, designated SEQ ID:4362, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28980] Another function of GAM189 is therefore inhibition of

GRAF (Accession NP_055886.1), a gene which ia a GTPase activating protein for p21- rac and therefore may be associated with Juvenile myelomonocytic leukemia. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Juvenile myelomonocytic leukemia, and of other diseases and clinical conditions associated with GRAF.

[28981] The function of GRAF has been established by previous studies. Borkhardt et al. (2000) stated that mutual translocations involving 11q23 in acute leukemias had been demonstrated to show fusion between the mixed lineage leukemia (MLL; 159555) gene and a variety of different partner genes to a total of 23. The detection of a unique t(5;11)(q31;q23) in an infant with juvenile myelomonocytic leukemia and an MLL gene rearrangement provided an opportunity to clone another MLL fusion partner gene. By cloning the breakpoints in this translocation, Borkhardt et al. (2000) recovered a member of the GTPase- activating protein (GAP) family, which they identified as the human homolog of the avian GRAF gene (Hildebrand et al., 1996). Ishikawa et al. (1998) cloned a GRAF cDNA, which they designated KIAA0621, from a human brain cDNA library and found that it encodes a de-

duced 753- amino acid protein with a molecular mass of 87 kD. Hildebrand et al. (1996) determined that the GRAF gene is highly homologous to the BCR gene (OMIM Ref. No. 151410), which is also involved in a leukemia- associated translocation. The avian GRAF protein binds to the C- terminal domain of pp125(FAK), one of the tyrosine kinases predicted to be a critical component of the integrin signaling transduction pathway, in an SH3 domain- dependent manner and stimulates the GTPase activity of the GTP- binding protein RhoA. Thus, GRAF acts as a negative regulator of RhoA.

[28982]

[28983] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28984] Borkhardt, A.; Bojesen, S.; Haas, O. A.; Fuchs, U.; Bartelheimer, D.; Loncarevic, I. F.; Bohle, R. M.; Harbott, J.; Repp, R.; Jaeger, U.; Viehmann, S.; Henn, T.; Korth, P.; Scharr, D.; Lampert, F. : The human GRAF gene is fused to MLL in a unique t(5;11)(q31;q23) and both alleles are disrupted in three cases of myelodysplastic syndrome/acute myeloid leukemia with a deletion 5q. Proc. Nat. Acad. Sci. 97: 9168- 9173, 2000. ; and

[28985] Hildebrand, J. D.; Taylor, J. M.; Parsons, T. J. : An SH3 domain- containing GTPase- activating protein for Rho and Cdc42 associates with focal adhesion kinase. Molec. Cell. Biol. 16: 31.

[28986] Further studies establishing the function and utilities of GRAF are found in John Hopkins OMIM database record ID 605370, and in cited publications listed in Table 5, which are hereby incorporated by reference.GREB1 (Accession NP_055483.2) is another GAM189 target gene, herein designated TARGET GENE. GREB1 BINDING SITE1 through GREB1 BINDING SITE3 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by GREB1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GREB1 BINDING SITE1 through GREB1 BINDING SITE3, designated SEQ ID:11815, SEQ ID:14861 and SEQ ID:9792 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28987] Another function of GAM189 is therefore inhibition of GREB1 (Accession NP_055483.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with GREB1.

[28988] Glutamate receptor, ionotropic, delta 1 (GRID1, Accession XP_043613.8) is another GAM189 target gene, herein designated TARGET GENE. GRID1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GRID1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GRID1 BINDING SITE, designated SEQ ID:17390, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28989] Another function of GAM189 is therefore inhibition of Glutamate receptor, ionotropic, delta 1 (GRID1, Accession XP_043613.8) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRID1.

[28990] Glutamate receptor, ionotropic, n-methyl d-aspartate-like 1a (GRINL1A, Accession NP_056347.1) is another GAM189 target gene, herein designated TARGET GENE. GRINL1A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GRINL1A, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GRINL1A BINDING SITE, designated SEQ ID:5433, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28991] Another function of GAM189 is therefore inhibition of Glutamate receptor, ionotropic, n-methyl d-aspartate-like 1a (GRINL1A, Accession NP_056347.1), a gene which plays a role in the development and function of the mammalian brain. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRINL1A.

[28992] The function of GRINL1A has been established by previous studies. The ionotropic glutamate receptors (e.g., GRIN1; 138249) play roles in the development and function of the mammalian brain. Roginski et al. (2001) isolated rat GRINL1 cDNA from a size- fractionated, directional rat brain cDNA library. They obtained human GRINL1A genomic DNA sequences by amplification with primers designed from the rat sequences. By fluorescence in situ hybridization, Roginski et al. (2001) mapped the GRINL1A gene to chromosome 15q22.1. By interspecific backcross analysis, Wydner et al. (2001) mapped the mouse Grinl1a

gene to chromosome 9 in a region that shares linkage conservation with human chromosome 15q21- q22.

[28993]

[28994] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28995] Roginski, R. S.; Mohan Raj, B. K.; Finkernagel, S. W.; Sciorra, L. J. : Assignment of an ionotropic glutamate receptor- like gene (GRINL1A) to human chromosome 15q22.1 by in situ hybridization. Cytogenet. Cell Genet. 93: 143- 144, 2001. ; and

[28996] Wydner, K. S.; Mohan Raj, B. K.; Sciorra, L. J.; Roginski, R. S. : The mouse orthologue of the human ionotropic glutamate receptor- like gene (GRINL1A) maps to mouse chromosome 9. Cytog.

[28997] Further studies establishing the function and utilities of GRINL1A are found in John Hopkins OMIM database record ID 606485, and in cited publications listed in Table 5, which are hereby incorporated by reference.Glutamate receptor, metabotropic 6 (GRM6, Accession NP_000834.1) is another GAM189 target gene, herein designated TARGET GENE. GRM6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GRM6,

corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GRM6 BINDING SITE, designated SEQ ID:10398, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[28998] Another function of GAM189 is therefore inhibition of Glutamate receptor, metabotropic 6 (GRM6, Accession NP_000834.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRM6.

[28999] GRWD (Accession NP_113673.2) is another GAM189 target gene, herein designated TARGET GENE. GRWD BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GRWD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GRWD BINDING SITE, designated SEQ ID:7996, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29000] Another function of GAM189 is therefore inhibition of GRWD (Accession NP_113673.2) . Accordingly, utilities of

GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRWD.

[29001] GSDM (Accession NP_835465.1) is another GAM189 target gene, herein designated TARGET GENE. GSDM BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GSDM, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GSDM BINDING SITE, designated SEQ ID:3199, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29002] Another function of GAM189 is therefore inhibition of GSDM (Accession NP_835465.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GSDM.

[29003] GSDM (Accession XP_209009.1) is another GAM189 target gene, herein designated TARGET GENE. GSDM BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GSDM, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide se-

quences of GSDM BINDING SITE, designated SEQ ID:3199, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29004] Another function of GAM189 is therefore inhibition of GSDM (Accession XP_209009.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GSDM.

[29005] Glutathione s-transferase m1 (GSTM1, Accession NP_666533.1) is another GAM189 target gene, herein designated TARGET GENE. GSTM1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GSTM1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GSTM1 BINDING SITE, designated SEQ ID:12752, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29006] Another function of GAM189 is therefore inhibition of Glutathione s-transferase m1 (GSTM1, Accession NP_666533.1), a gene which is conjugation of reduced glutathione to a wide number of exogenous and endogenous hydrophobic electrophiles. and therefore may be as-

sociated with Aplastic anemia and cancer. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Aplastic anemia and cancer, and of other diseases and clinical conditions associated with GSTM1.

[29007] The function of GSTM1 has been established by previous studies. The mu class glutathione transferase GSTM1 is absent from more than 50% of some populations (Board et al., 1990). This deficiency appears to be caused by the deletion of the GSTM1 gene (18,16:Seidegard et al., 1988, 1990); a null allele at the GSTM1 locus is found in 40 to 45% of Caucasians. GSTM1 deficiency may be a risk factor for cancer by providing increased sensitivity to particular chemical carcinogens (Strange et al., 1991; van Poppel et al., 1992). Seidegard et al. (1986, 1990) found an association between the GSTM1 null phenotype and susceptibility to lung cancer. Zhong et al. (1993) found a significant excess of 'nulled' individuals among cases of colorectal cancer: 56.1% compared with the control group value of 41.8%. More than 70% of individuals with a tumor in the proximal colon were GSTM1 nulled, in their terminology. Patients with reduced ability to metabolize environmental carcinogens or toxins may be at risk of developing aplastic anemia. GST has been implicated in detoxifying muta-

genic electrophilic compounds. Lee et al. (2001) investigated whether homozygous deletions of GSTM1 and GSTT1 affect the likelihood of developing aplastic anemia. They found that the incidence of GSTM1 and GSTT1 gene deletions was significantly higher for aplastic anemia patients than for healthy controls (odds ratio = 3.1, P = 0.01, and odds ratio = 3.1, P = 0.004, respectively). Among the aplastic anemia patients, 17.5% had chromosomal abnormalities at the time of diagnosis, and all aplastic anemia patients with chromosomal abnormalities showed GSTT1 gene deletions.

[29008]

[29009] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[29010] van Poppel, G.; de Vogel, N.; van Bladeren, P. J.; Kok, F. J. : Increased cytogenetic damage in smokers deficient in glutathione S- transferase isozyme mu. Carcinogenesis 13: 303- 305, 1992. ; and

[29011] Lee, K. A.; Kim, S. H.; Woo, H. Y.; Hong, Y. J.; Cho, H. C. : Increased frequencies of glutathione S- transferase (GSTM1 and GSTT1) gene deletions in Korean patients with acquired aplasti.

[29012] Further studies establishing the function and utilities of GSTM1 are found in John Hopkins OMIM database record ID 138350, and in cited publications listed in Table 5, which are hereby incorporated by reference.Glutathione s-transferase m1 (GSTM1, Accession NP_000552.2) is another GAM189 target gene, herein designated TARGET GENE. GSTM1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GSTM1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GSTM1 BINDING SITE, designated SEQ ID:12752, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29013] Another function of GAM189 is therefore inhibition of Glutathione s-transferase m1 (GSTM1, Accession NP_000552.2), a gene which is conjugation of reduced glutathione to a wide number of exogenous and endogenous hydrophobic electrophiles. and therefore may be associated with Aplastic anemia and cancer. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Aplastic anemia and cancer, and of other

diseases and clinical conditions associated with GSTM1.

[29014] The function of GSTM1 has been established by previous studies. The mu class glutathione transferase GSTM1 is absent from more than 50% of some populations (Board et al., 1990). This deficiency appears to be caused by the deletion of the GSTM1 gene (18,16:Seidegard et al., 1988, 1990); a null allele at the GSTM1 locus is found in 40 to 45% of Caucasians. GSTM1 deficiency may be a risk factor for cancer by providing increased sensitivity to particular chemical carcinogens (Strange et al., 1991; van Poppel et al., 1992). Seidegard et al. (1986, 1990) found an association between the GSTM1 null phenotype and susceptibility to lung cancer. Zhong et al. (1993) found a significant excess of 'nulled' individuals among cases of colorectal cancer: 56.1% compared with the control group value of 41.8%. More than 70% of individuals with a tumor in the proximal colon were GSTM1 nulled, in their terminology. Patients with reduced ability to metabolize environmental carcinogens or toxins may be at risk of developing aplastic anemia. GST has been implicated in detoxifying mutagenic electrophilic compounds. Lee et al. (2001) investigated whether homozygous deletions of GSTM1 and GSTT1 affect the likelihood of developing aplastic anemia.

They found that the incidence of GSTM1 and GSTT1 gene deletions was significantly higher for aplastic anemia patients than for healthy controls (odds ratio = 3.1, P = 0.01, and odds ratio = 3.1, P = 0.004, respectively). Among the aplastic anemia patients, 17.5% had chromosomal abnormalities at the time of diagnosis, and all aplastic anemia patients with chromosomal abnormalities showed GSTT1 gene deletions.

[29015]

[29016] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[29017] van Poppel, G.; de Vogel, N.; van Bladeren, P. J.; Kok, F. J. : Increased cytogenetic damage in smokers deficient in glutathione S- transferase isozyme mu. Carcinogenesis 13: 303- 305, 1992. ; and

[29018] Lee, K. A.; Kim, S. H.; Woo, H. Y.; Hong, Y. J.; Cho, H. C. : Increased frequencies of glutathione S- transferase (GSTM1 and GSTT1) gene deletions in Korean patients with acquired aplasti.

[29019] Further studies establishing the function and utilities of GSTM1 are found in John Hopkins OMIM database record ID 138350, and in cited publications listed in Table 5,

which are hereby incorporated by reference.Glutathione s-transferase m2 (muscle) (GSTM2, Accession NP_000839.1) is another GAM189 target gene, herein designated TARGET GENE. GSTM2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GSTM2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GSTM2 BINDING SITE, designated SEQ ID:12752, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29020] Another function of GAM189 is therefore inhibition of Glutathione s-transferase m2 (muscle) (GSTM2, Accession NP_000839.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GSTM2.

[29021] Glutathione s-transferase m4 (GSTM4, Accession NP_671490.1) is another GAM189 target gene, herein designated TARGET GENE. GSTM4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GSTM4, corresponding to a target binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GSTM4 BINDING SITE, designated SEQ ID:12752, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29022] Another function of GAM189 is therefore inhibition of Glutathione s-transferase m4 (GSTM4, Accession NP_671490.1), a gene which conjugates reduced glutathione to a wide number of exogenous and endogenous hydrophobic electrophiles. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GSTM4.

[29023] The function of GSTM4 has been established by previous studies. Glutathione S- transferases (GSTs) are a complex family of multifunctional enzymes thought to play a significant role in cellular detoxification. Cytosolic GSTs have been subdivided into 4 classes: alpha, mu, pi, and theta. Four isoenzymes of the mu class have been identified: GSTM1 (OMIM Ref. No. 138350), GSTM2 (OMIM Ref. No. 138380), GSTM3 (OMIM Ref. No. 138390), and GSTM4. Ross and Board (1993) cloned and characterized GSTM4. Ross et al. (1993) reported that a probe derived from GSTM4 cross- hybridizes with the other 3 known human

mu class GST genes. In situ hybridization with the GSTM4 probe localized a major region of hybridization on 1p13. An identical pattern of hybridization was observed in individuals with or without the GSTM1 gene. Taylor et al. (1991) found that GSTM4 and GSTM2 were located in the same cosmid. Comstock et al. (1993) reported the complete gene sequence and cDNA sequence of GSTM4. The deduced amino acid sequence of GSTM4 was 87% identical to GSTM1, 83% identical to GSTM2, and 70% identical to GSTM3. Using PCR amplification of a unique region of the GSTM4 gene from a panel of rodent- human somatic cell hybrid DNAs, Comstock et al. (1993) determined that the GSTM4 gene is located on chromosome 1.

[29024]

[29025] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[29026] Ross, V. L.; Board, P. G. : Molecular cloning and heterologous expression of an alternatively spliced human mu class glutathione S- transferase transcript. Biochem. J. 294: 373- 380, 1993. ; and

[29027] Comstock, K. E.; Johnson, K. J.; Rifenbery, D.; Henner, W. D. : Isolation and analysis of the gene and cDNA for a hu-

man mu class glutathione S- transferase, GSTM4. J. Biol. Chem. 268: 169.

[29028] Further studies establishing the function and utilities of GSTM4 are found in John Hopkins OMIM database record ID 138333, and in cited publications listed in Table 5, which are hereby incorporated by reference.Glutathione s-transferase m4 (GSTM4, Accession NP_000841.1) is another GAM189 target gene, herein designated TARGET GENE. GSTM4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GSTM4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GSTM4 BINDING SITE, designated SEQ ID:12752, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29029] Another function of GAM189 is therefore inhibition of Glutathione s-transferase m4 (GSTM4, Accession NP_000841.1), a gene which conjugates reduced glutathione to a wide number of exogenous and endogenous hydrophobic electrophiles. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with GSTM4.

[29030] The function of GSTM4 has been established by previous studies. Glutathione S- transferases (GSTs) are a complex family of multifunctional enzymes thought to play a significant role in cellular detoxification. Cytosolic GSTs have been subdivided into 4 classes: alpha, mu, pi, and theta. Four isoenzymes of the mu class have been identified: GSTM1 (OMIM Ref. No. 138350), GSTM2 (OMIM Ref. No. 138380), GSTM3 (OMIM Ref. No. 138390), and GSTM4. Ross and Board (1993) cloned and characterized GSTM4. Ross et al. Taylor et al. (1991) found that GSTM4 and GSTM2 were located in the same cosmid. Comstock et al. (1993) reported the complete gene sequence and cDNA sequence of GSTM4. The deduced amino acid sequence of GSTM4 was 87% identical to GSTM1, 83% identical to GSTM2, and 70% identical to GSTM3. Using PCR amplification of a unique region of the GSTM4 gene from a panel of rodent- human somatic cell

hybrid DNAs, Comstock et al. (1993) determined that the GSTM4 gene is located on chromosome 1.

[29031]

[29032] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[29033] Ross, V. L.; Board, P. G. : Molecular cloning and heterologous expression of an alternatively spliced human mu class glutathione S- transferase transcript. Biochem. J. 294: 373- 380, 1993. ; and

[29034] Comstock, K. E.; Johnson, K. J.; Rifenbery, D.; Henner, W. D. : Isolation and analysis of the gene and cDNA for a human mu class glutathione S- transferase, GSTM4. J. Biol. Chem. 268: 169.

[29035] Further studies establishing the function and utilities of GSTM4 are found in John Hopkins OMIM database record ID 138333, and in cited publications listed in Table 5, which are hereby incorporated by reference.General transcription factor iie, polypeptide 1, alpha 56kda (GTF2E1, Accession NP_005504.1) is another GAM189 target gene, herein designated TARGET GENE. GTF2E1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GTF2E1, corresponding to a target

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GTF2E1 BINDING SITE, designated SEQ ID:15661, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29036] Another function of GAM189 is therefore inhibition of General transcription factor iie, polypeptide 1, alpha 56kda (GTF2E1, Accession NP_005504.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTF2E1.

[29037] GTF2IRD2 (Accession NP_115579.3) is another GAM189 target gene, herein designated TARGET GENE. GTF2IRD2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GTF2IRD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GTF2IRD2 BINDING SITE, designated SEQ ID:11522, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29038] Another function of GAM189 is therefore inhibition of GTF2IRD2 (Accession NP_115579.3) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTF2IRD2.

[29039] GTF2IRD2 (Accession NP_775808.1) is another GAM189 target gene, herein designated TARGET GENE. GTF2IRD2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GTF2IRD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GTF2IRD2 BINDING SITE, designated SEQ ID:11522, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29040] Another function of GAM189 is therefore inhibition of GTF2IRD2 (Accession NP_775808.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTF2IRD2.

[29041] GTPBG3 (Accession NP_116009.1) is another GAM189 target gene, herein designated TARGET GENE. GTPBG3 BIND-

ING SITE1 and GTPBG3 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by GTPBG3, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GTPBG3 BINDING SITE1 and GTPBG3 BINDING SITE2, designated SEQ ID:7812 and SEQ ID:10292 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29042] Another function of GAM189 is therefore inhibition of GTPBG3 (Accession NP_116009.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTPBG3.

[29043] Glycogenin (GYG, Accession NP_004121.2) is another GAM189 target gene, herein designated TARGET GENE. GYG BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GYG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GYG BINDING SITE, designated SEQ ID:4258, to the nucleotide sequence of GAM189 RNA, herein designated

GAM RNA, also designated SEQ ID:246.

[29044] Another function of GAM189 is therefore inhibition of Glycogenin (GYG, Accession NP_004121.2), a gene which primes de novo glycogen synthesis. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GYG.

[29045] The function of GYG has been established by previous studies. Glycogenin is a self- glucosylating protein involved in the initiation reactions of glycogen synthesis. During initiation, the covalent attachment of a glucose residue to glycogenin is followed by elongation to form an oligosaccharide chain. Viskupic et al. (1992) isolated cDNAs encoding glycogenin from rabbit muscle, rat, and cow. Recombinant mammalian glycogenin was enzymatically active and capable of self- glucosylation. After incubation with UDP- glucose, the recombinant protein was able to serve as a substrate for glycogen synthase, leading to the production of high M(r) polysaccharide. Barbetti et al. (1996) identified a human glycogenin cDNA. The predicted 333- amino acid human protein shares 93% identity with rabbit muscle glycogenin. Northern blot analysis revealed that the 2.4- kb glycogenin mRNA was expressed prominently in human skeletal muscle and heart, and to a

lesser extent in several other tissues. Mu et al. (1997) isolated cDNAs encoding a related protein, which they designated glycogenin- 2 (OMIM Ref. No. 300198). They suggested that muscle glycogenin be referred to as glycogenin- 1.

[29046]

[29047] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[29048] Barbetti, F.; Rocchi, M.; Bossolasco, M.; Cordera, R.; Sbraccia, P.; Finelli, P.; Consalez, G. G. : The human skeletal muscle glycogenin gene: cDNA, tissue expression, and chromosomal localization. Biochem. Biophys. Res. Commun. 220: 72- 77, 1996. ; and

[29049] Mu, J.; Skurat, A. V.; Roach, P. J. : Glycogenin- 2, a novel self- glucosylating protein involved in liver glycogen biosynthesis. J. Biol. Chem. 272: 27589- 27597, 1997.

[29050] Further studies establishing the function and utilities of GYG are found in John Hopkins OMIM database record ID 603942, and in cited publications listed in Table 5, which are hereby incorporated by reference.H-plk (Accession NP_056936.1) is another GAM189 target gene, herein designated TARGET GENE. H-plk BINDING SITE is a target

binding site found in the 5` untranslated region of mRNA encoded by H-plk, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of H-plk BINDING SITE, designated SEQ ID:12753, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29051] Another function of GAM189 is therefore inhibition of H-plk (Accession NP_056936.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H-plk.

[29052] H2AV (Accession NP_619541.1) is another GAM189 target gene, herein designated TARGET GENE. H2AV BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by H2AV, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of H2AV BINDING SITE, designated SEQ ID:18864, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29053] Another function of GAM189 is therefore inhibition of

H2AV (Accession NP_619541.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H2AV.

[29054] H63 (Accession NP_816929.1) is another GAM189 target gene, herein designated TARGET GENE. H63 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by H63, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of H63 BINDING SITE, designated SEQ ID:4554, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29055] Another function of GAM189 is therefore inhibition of H63 (Accession NP_816929.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H63.

[29056] H63 (Accession NP_612432.2) is another GAM189 target gene, herein designated TARGET GENE. H63 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by H63, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4

illustrates the complementarity of the nucleotide sequences of H63 BINDING SITE, designated SEQ ID:4554, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29057] Another function of GAM189 is therefore inhibition of H63 (Accession NP_612432.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H63.

[29058] Hepatitis a virus cellular receptor 2 (HAVCR2, Accession NP_116171.2) is another GAM189 target gene, herein designated TARGET GENE. HAVCR2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HAVCR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HAVCR2 BINDING SITE, designated SEQ ID:16260, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29059] Another function of GAM189 is therefore inhibition of Hepatitis a virus cellular receptor 2 (HAVCR2, Accession NP_116171.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with HAVCR2.

[29060] HE9 (Accession NP_741997.1) is another GAM189 target gene, herein designated TARGET GENE. HE9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HE9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HE9 BINDING SITE, designated SEQ ID:7942, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29061] Another function of GAM189 is therefore inhibition of HE9 (Accession NP_741997.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HE9.

[29062] Hephaestin (HEPH, Accession NP_055614.1) is another GAM189 target gene, herein designated TARGET GENE. HEPH BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by HEPH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HEPH BINDING SITE, designated

SEQ ID:15338, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29063] Another function of GAM189 is therefore inhibition of Hephaestin (HEPH, Accession NP_055614.1), a gene which is thought to be a membrane- bound protein responsible for transport of dietary iron from epithelial cells of the intestinal lumen into the circulatory system. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEPH.

[29064] The function of HEPH has been established by previous studies. Vulpe et al. (1999) found that Heph expression contrasts that of Cp, which is highly expressed in liver and expressed to a lesser extent in other tissues, including brain and lung, but is not expressed in intestine, where the highest expression of Heph is found. In situ hybridization studies indicated that intestinal expression of Heph is limited to villi, with almost no signal observed in crypt cells. Iron absorption occurs in villi. Vulpe et al. (1999) found that sla mice have a deletion of 582 nucleotides from the Heph gene, predicting an in- frame omission of 194 amino acids in the gene product. On the

basis of its homology with ceruloplasmin, Vulpe et al. (1999) proposed that hephaestin is a ferroxidase necessary for iron release from intestinal epithelial cells. Since it contains only 1 putative membrane- spanning domain, it is unlikely to be a transmembrane iron carrier itself; hephaestin may interact with an iron- transport protein to facilitate the movement of iron across the membrane. Hephaestin represents a link between copper and iron metabolism in mammals and offers a basis for the iron-deficiency anemia associated with copper deficiency. Copper deficiency results in the decreased absorption of dietary iron, which enters intestinal epithelium normally but cannot exit into the circulation. Indeed, intestinal iron accumulation in copper- deficient swine is similar to the iron accumulation seen in sla mice (Lee et al., 1968). The administration of copper, but not iron, to copper- deficient pigs alleviates the anemia and facilitates the egress of iron from tissues, including intestine.

[29065]

[29066] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[29067] Vulpe, C. D.; Kuo, Y.- M.; Murphy, T. L.; Cowley, L.;

Askwith, C.; Libina, N.; Gitschier, J.; Anderson, G. J. : Hephaestin, a ceruloplasmin homologue implicated in intestinal iron transport, is defective in the sla mouse. Nature Genet. 21: 195- 199, 1999. ; and

[29068] Lee, G. R.; Nacht, S.; Lukens, J. N.; Cartwright, G. E. : Iron metabolism in copper- deficient swine. J. Clin. Invest. 47: 2058- 2069, 1968.

[29069] Further studies establishing the function and utilities of HEPH are found in John Hopkins OMIM database record ID 300167, and in cited publications listed in Table 5, which are hereby incorporated by reference.Hexosaminidase a (alpha polypeptide) (HEXA, Accession NP_000511.1) is another GAM189 target gene, herein designated TARGET GENE. HEXA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HEXA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HEXA BINDING SITE, designated SEQ ID:14035, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29070] Another function of GAM189 is therefore inhibition of Hexosaminidase a (alpha polypeptide) (HEXA, Accession

NP_000511.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEXA.

[29071] Holocarboxylase synthetase (biotin-[proprionyl-coenzyme a-carboxylase (atp-hydrolysing)] ligase) (HLCS, Accession NP_000402.2) is another GAM189 target gene, herein designated TARGET GENE. HLCS BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HLCS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HLCS BINDING SITE, designated SEQ ID:2142, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29072] Another function of GAM189 is therefore inhibition of Holocarboxylase synthetase (biotin-[proprionyl-coenzyme a-carboxylase (atp-hydrolysing)] ligase) (HLCS, Accession NP_000402.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HLCS.

[29073] High-mobility group 20a (HMG20A, Accession NP_060670.1) is another GAM189 target gene, herein designated TARGET GENE. HMG20A BINDING SITE is a tar-

get binding site found in the 3` untranslated region of mRNA encoded by HMG20A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HMG20A BINDING SITE, designated SEQ ID:5040, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29074] Another function of GAM189 is therefore inhibition of High-mobility group 20a (HMG20A, Accession NP_060670.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMG20A.

[29075] HPRN (Accession NP_071938.1) is another GAM189 target gene, herein designated TARGET GENE. HPRN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HPRN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HPRN BINDING SITE, designated SEQ ID:12916, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29076] Another function of GAM189 is therefore inhibition of HPRN (Accession NP_071938.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPRN.

[29077] Histamine receptor h4 (HRH4, Accession NP_067637.2) is another GAM189 target gene, herein designated TARGET GENE. HRH4 BINDING SITE1 and HRH4 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by HRH4, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HRH4 BINDING SITE1 and HRH4 BINDING SITE2, designated SEQ ID:3116 and SEQ ID:18211 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29078] Another function of GAM189 is therefore inhibition of Histamine receptor h4 (HRH4, Accession NP_067637.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRH4.

[29079] Hmt1 hnrnp methyltransferase-like 3 (s. cerevisiae) (HRMT1L3, Accession NP_062828.2) is another GAM189

target gene, herein designated TARGET GENE. HRMT1L3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HRMT1L3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HRMT1L3 BINDING SITE, designated SEQ ID:18437, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29080] Another function of GAM189 is therefore inhibition of Hmt1 hnrnp methyltransferase-like 3 (s. cerevisiae) (HRMT1L3, Accession NP_062828.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRMT1L3.

[29081] HSD3B7 (Accession NP_079469.2) is another GAM189 target gene, herein designated TARGET GENE. HSD3B7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HSD3B7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HSD3B7 BINDING SITE, designated SEQ ID:2674, to the nucleotide

sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29082] Another function of GAM189 is therefore inhibition of HSD3B7 (Accession NP_079469.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSD3B7.

[29083] HSMPP8 (Accession XP_167894.1) is another GAM189 target gene, herein designated TARGET GENE. HSMPP8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HSMPP8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HSMPP8 BINDING SITE, designated SEQ ID:7797, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29084] Another function of GAM189 is therefore inhibition of HSMPP8 (Accession XP_167894.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSMPP8.

[29085] Heat shock 70kda protein 4 (HSPA4, Accession

XP_114482.1) is another GAM189 target gene, herein designated TARGET GENE. HSPA4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HSPA4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HSPA4 BINDING SITE, designated SEQ ID:15189, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29086] Another function of GAM189 is therefore inhibition of Heat shock 70kda protein 4 (HSPA4, Accession XP_114482.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPA4.

[29087] HSPC065 (Accession NP_054876.2) is another GAM189 target gene, herein designated TARGET GENE. HSPC065 BINDING SITE1 and HSPC065 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by HSPC065, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HSPC065 BINDING SITE1 and

HSPC065 BINDING SITE2, designated SEQ ID:4676 and SEQ ID:713 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29088] Another function of GAM189 is therefore inhibition of HSPC065 (Accession NP_054876.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC065.

[29089] 5-hydroxytryptamine (serotonin) receptor 1d (HTR1D, Accession NP_000855.1) is another GAM189 target gene, herein designated TARGET GENE. HTR1D BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HTR1D, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HTR1D BINDING SITE, designated SEQ ID:2563, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29090] Another function of GAM189 is therefore inhibition of 5-hydroxytryptamine (serotonin) receptor 1d (HTR1D, Accession NP_000855.1), a gene which belongs to g- pro-

tein coupled receptor. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTR1D.

[29091] The function of HTR1D has been established by previous studies. The serotonin 1D receptor was initially characterized by radioligand binding procedures using membranes derived from bovine caudate nucleus. The 5- HT- 1D receptor is known to be a G protein- coupled receptor. Sumatriptan, an agent effective in the treatment of acute migraine, is the only ligand yet identified that is selective for the 5- HT- 1D receptor. Weinshank et al. (1992) reported the cloning, deduced amino acid sequences, pharmacologic properties, and second- messenger coupling of a pair of human 5- HT- 1D receptor genes, which they designated alpha and beta due to their strong similarities. Both genes have no introns in their coding regions, are expressed in the human cerebral cortex, and can couple to inhibition of adenylate cyclase activity. Their pharmacologic binding properties match closely those of human, bovine, and guinea pig 5- HT- 1D sites. Libert et al. (1991) obtained cDNA clones encoding 4 receptors of the G protein- coupled receptor family by selective amplification and cloning from thyroid cDNA. One of these clones,

termed RDC4 by them, showed close structural similarity with the serotonin 5HT1A receptor (OMIM Ref. No. 109760). By in situ hybridization, they demonstrated that the gene (HTR1D) is located on chromosome 1 at 1p36.3-p34.3. By Southern blot analysis of a hybrid cell panel, Jin et al. (1992) showed that the HTR1D gene is located on chromosome 1. Wilkie et al. (1993) showed that the homologous gene in the mouse is located on chromosome 4.

[29092]

[29093] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[29094] Weinshank, R. L.; Zgombick, J. M.; Macchi, M. J.; Branchek, T. A.; Hartig, P. R. : Human serotonin 1D receptor is encoded by a subfamily of two distinct genes: 5- HT(1D- alpha) and 5- HT(1D- beta). Proc. Nat. Acad. Sci. 89: 3630-3634, 1992. ; and

[29095] Wilkie, T. M.; Chen, Y.; Gilbert, D. J.; Moore, K. J.; Yu, L.; Simon, M. I.; Copeland, N. G.; Jenkins, N. A. : Identification, chromosomal location, and genome organization of mammalian.

[29096] Further studies establishing the function and utilities of

HTR1D are found in John Hopkins OMIM database record ID 182133, and in cited publications listed in Table 5, which are hereby incorporated by reference.Hormonally upregulated neu-associated kinase (HUNK, Accession NP_055401.1) is another GAM189 target gene, herein designated TARGET GENE. HUNK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HUNK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HUNK BINDING SITE, designated SEQ ID:17952, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29097] Another function of GAM189 is therefore inhibition of Hormonally upregulated neu-associated kinase (HUNK, Accession NP_055401.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HUNK.

[29098] Hus1 checkpoint homolog (s. pombe) (HUS1, Accession NP_004498.1) is another GAM189 target gene, herein designated TARGET GENE. HUS1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by HUS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HUS1 BINDING SITE, designated SEQ ID:14238, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29099] Another function of GAM189 is therefore inhibition of Hus1 checkpoint homolog (s. pombe) (HUS1, Accession NP_004498.1), a gene which May form DNA damage- responsive protein complex . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HUS1.

[29100] The function of HUS1 has been established by previous studies. The S. pombe 'checkpoint rad' genes hus1, rad1 (OMIM Ref. No. 603153), rad3, rad9 (OMIM Ref. No. 603761), rad17 (OMIM Ref. No. 603139), and rad26 are essential for both the incomplete DNA replication (S- M) and DNA damage checkpoints. An early step in the DNA damage checkpoint response appears to involve activation of the rad3 phosphatidylinositol 3- kinase- related (PIK-R) checkpoint kinase (see OMIM Ref. No. AT; 208900) by the other 5 checkpoint rad gene products. Kostrub et al.

(1998) found that the fission yeast hus1 and rad1 proteins form a stable complex, and that the formation of this complex is dependent on rad9, suggesting that these 3 proteins may exist in a discrete complex in the absence of checkpoint activation. Hus1 is phosphorylated in response to DNA damage, and this phosphorylation requires rad3 and the other checkpoint rad genes. By searching EST databases, Kostrub et al. (1998) and Dean et al. (1998) each identified mouse and human cDNAs encoding hus1 homologs. Kostrub et al. (1998) reported that the predicted 281- amino acid human protein shares 30% and 86% identity with S. pombe hus1 and mouse Hus1, respectively. However, neither mammalian gene complemented a fission yeast hus1 mutation. Volkmer and Karnitz (1999) demonstrated that the human RAD1 and HUS1 proteins associate in a complex that interacts with a highly modified form of RAD9. They concluded that these 3 proteins are central components of a DNA damage- responsive protein complex in human cells. AU- rich elements (AREs) are cis- acting sequences typically found in 3- prime untranslated regions of many labile mRNAs. AREs either mediate rapid degradation of mRNA or inhibit its translation. Dominguez et al. (1998) identified EE2-

16C, a HUS1 cDNA, among a collection of ARE- containing mRNAs.

[29101]

[29102] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[29103] Kostrub, C. F.; Knudsen, K.; Subramani, S.; Enoch, T. : Hus1p, a conserved fission yeast checkpoint protein, interacts with Rad1p and is phosphorylated in response to DNA damage. EMBO J. 17: 2055- 2066, 1998. ; and

[29104] Volkmer, E.; Karnitz, L. M. : Human homologs of Schizosaccharomyces pombe Rad1, Hus1, and Rad9 form a DNA damage- responsive protein complex. J. Biol. Chem. 274: 567- 570, 1999.

[29105] Further studies establishing the function and utilities of HUS1 are found in John Hopkins OMIM database record ID 603760, and in cited publications listed in Table 5, which are hereby incorporated by reference.Hyaluronoglucosaminidase 4 (HYAL4, Accession NP_036401.1) is another GAM189 target gene, herein designated TARGET GENE. HYAL4 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HYAL4, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HYAL4 BINDING SITE, designated SEQ ID:2143, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29106] Another function of GAM189 is therefore inhibition of Hyaluronoglucosaminidase 4 (HYAL4, Accession NP_036401.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HYAL4.

[29107] HYPB (Accession NP_036403.1) is another GAM189 target gene, herein designated TARGET GENE. HYPB BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HYPB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HYPB BINDING SITE, designated SEQ ID:14422, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29108] Another function of GAM189 is therefore inhibition of HYPB (Accession NP_036403.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with HYPB.

[29109] Intercellular adhesion molecule 1 (cd54), human rhinovirus receptor (ICAM1, Accession NP_000192.1) is another GAM189 target gene, herein designated TARGET GENE. ICAM1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ICAM1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ICAM1 BINDING SITE, designated SEQ ID:12075, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29110] Another function of GAM189 is therefore inhibition of Intercellular adhesion molecule 1 (cd54), human rhinovirus receptor (ICAM1, Accession NP_000192.1), a gene which binds the integrin LFA- 1 (ITGB2) and promotes adhesion; member of the immunoglobulin superfamily and therefore may be associated with Malaria, cerebral, susceptibility to. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Malaria, cerebral, susceptibility to, and of other diseases and clinical conditions associated with ICAM1.

[29111] The function of ICAM1 has been established by previous

studies. Intercellular adhesion molecule- 1 (ICAM1) is a ligand for lymphocyte- function associated (LFA) antigens (see OMIM Ref. No. 116920). Simmons et al. (1988) analyzed a cDNA clone of the ICAM1 gene and found that it showed homology to the neural cell adhesion molecule NCAM (OMIM Ref. No. 116930). Greve et al. (1989) demonstrated that the ICAM1 protein is the major human rhinovirus receptor. Bella et al. (1998) analyzed the structural features of the ICAM1 molecule that underlie its function as a receptor for the major group of human rhinoviruses and as a ligand for LFA- 1. Expression of HLA-DR antigen (see OMIM Ref. No. 142860) and ICAM1 in human conjunctival epithelium is upregulated in patients with dry eyes associated with Sjogren syndrome (OMIM Ref. No. 270150). Tsubota et al. (1999) reported that this upregulation in Sjogren syndrome patients may be controlled by interferon- gamma (OMIM Ref. No. 147570) through the activation of transcription factor NFKB (nuclear OMIM Ref. No. 164011). Pisella et al. (2000) reported that a significant increase of HLA- DR and ICAM1 expression by epithelial cells was consistently found in patients with keratoconjunctivitis sicca (Sjogren syndrome) compared with expression in normal eyes. These 2

markers were well correlated with each other and correlated inversely with tear break- up time and tear production as measured by the Schirmer test. The percentage of conjunctival goblet cells was significantly decreased in dry eye patients with a significant negative correlation with both HLA- DR and ICAM1 markers. Lu and Cyster (2002) studied the mechanisms that control localization of marginal zone B cells. They demonstrated that marginal zone B cells express elevated levels of the integrins LFA-1 (see OMIM Ref. No. 153370) and alpha- 4- beta- 1 (see OMIM Ref. No. 192975 and 135630), and that the marginal zone B cells bind to the ligands ICAM1 and VCAM1 (OMIM Ref. No. 192225). These ligands are expressed within the marginal zone in a lymphotoxin- dependent manner. Combined inhibition of LFA- 1 and alpha- 4- beta- 1 causes a rapid and selective release of B cells from the marginal zone. Furthermore, lipopolysaccharide- triggered marginal zone B cell relocalization involves downregulation of integrin- mediated adhesion. Lu and Cyster (2002) concluded that their studies identified key requirements for marginal zone B cell localization and established a role for integrins in peripheral lymphoid tissue compartmentalization.

[29112] Animal model experiments lend further support to the function of ICAM1. To test the role of Icam1 in intact animals, Sligh et al. (1993) disrupted the gene in murine embryonic stem cells by gene targeting. Homozygous deficient animals developed normally, were fertile, and had a moderate granulocytosis. Studies were consistent with complete loss of surface expression of the protein. Deficient mice exhibited prominent abnormalities of inflammatory responses including impaired neutrophil emigration in response to chemical peritonitis and decreased contact hypersensitivity to 2,4- dinitrofluorobenzene. Mutant cells provided negligible stimulation in the mixed lymphocyte reaction, although they proliferated normally as responder cells

[29113] It is appreciated that the abovementioned animal model for ICAM1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[29117] Further studies establishing the function and utilities of ICAM1 are found in John Hopkins OMIM database record ID 147840, and in cited publications listed in Table 5, which are hereby incorporated by reference.ICK (Accession NP_055735.1) is another GAM189 target gene, herein designated TARGET GENE. ICK BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ICK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ICK BINDING SITE, designated SEQ ID:7385, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29118] Another function of GAM189 is therefore inhibition of ICK (Accession NP_055735.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with ICK.

[29119] ICK (Accession NP_057597.2) is another GAM189 target gene, herein designated TARGET GENE. ICK BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ICK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ICK BINDING SITE, designated SEQ ID:7385, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29120] Another function of GAM189 is therefore inhibition of ICK (Accession NP_057597.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICK.

[29121] Insulin-like growth factor 1 (somatomedin c) (IGF1, Accession NP_000609.1) is another GAM189 target gene, herein designated TARGET GENE. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IGF1 BINDING SITE, desig-

nated SEQ ID:6279, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29122] Another function of GAM189 is therefore inhibition of Insulin-like growth factor 1 (somatomedin c) (IGF1, Accession NP_000609.1), a gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore may be associated with Growth retardation with sensorineural deafness and mental retardation. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Growth retardation with sensorineural deafness and mental retardation, and of other diseases and clinical conditions associated with IGF1.

[29123] The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM66.2.Immunoglobulin mu binding protein 2 (IGHMBP2, Accession NP_002171.1) is another GAM189 target gene, herein designated TARGET GENE. IGHMBP2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by IGHMBP2, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IGHMBP2 BINDING SITE, designated SEQ ID:17385, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29124] Another function of GAM189 is therefore inhibition of Immunoglobulin mu binding protein 2 (IGHMBP2, Accession NP_002171.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGHMBP2.

[29125] Immunoglobulin lambda-like polypeptide 1 (IGLL1, Accession NP_690594.1) is another GAM189 target gene, herein designated TARGET GENE. IGLL1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by IGLL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IGLL1 BINDING SITE, designated SEQ ID:4573, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29126] Another function of GAM189 is therefore inhibition of Immunoglobulin lambda-like polypeptide 1 (IGLL1, Acces-

sion NP_690594.1), a gene which expressed only in pre-b- cells and a special b- cell line (which is surface ig negative). and therefore may be associated with Agammaglobulinemia, autosomal recessive. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Agammaglobulinemia, autosomal recessive, and of other diseases and clinical conditions associated with IGLL1.

[29127] The function of IGLL1 has been established by previous studies. The VpreB (OMIM Ref. No. 605141) and lambda-5 genes encode the iota and omega polypeptide chains, respectively (Pillai and Baltimore, 1988), which associate with the immunoglobulin (Ig) mu chain to form a molecular complex that is expressed on the surface of pre- B cells. This complex presumably regulates Ig gene rearrangements in the early steps of B- cell differentiation. In the mouse the 2 genes are simultaneously expressed in pre- B cells, are only 4.6 kb apart, and belong to the same transcription unit. A primary transcript is synthesized from which the pre- B and lambda- 5 mRNAs are derived by alternative splicing. In the human, however, Mattei et al. (1991) concluded that the 2 genes, designated VPREB1 and IGLL1, are separate. Schiff et al. (1989) isolated from

a human fetal liver cDNA library clones that were only 85% homologous to the functional C- lambda genes (IGLC; 147220) and showed that they represent additional non-allelic members of a C- lambda- like family. Using pulsed field gel electrophoresis, the genes were shown to be present on a 200- kb DNA fragment, distinct from the C-lambda cluster. A splicing event accounted for differences between the 2 cDNAs. By in situ hybridization, Mattei et al. (1991) demonstrated that the pre- B- specific lambda-like cluster is located in the 22q11.2- q12.3 region, distal to the IgC lambda locus. B- cell precursors transiently express a pre- B cell receptor complex consisting of a rearranged mu heavy chain, a surrogate light chain composed of lambda- 5/14.1 and VpreB, and the immunoglobulin-associated signal transducing chains, Ig- alpha and Ig-beta. Mutations in the mu heavy chain are associated with complete failure of B- cell development in both humans and mice. In humans, the picture is that of autosomal recessive agammaglobulinemia (147020.0001 ff). Mutations in murine lambda- 5 result in a 'leaky' phenotype with detectable humoral responses. In evaluating patients with agammaglobulinemia and markedly reduced numbers of B cells, Minegishi et al. (1998) identified a boy with muta-

tions on both alleles of the gene encoding lambda-5/14.1. The maternal allele carried a premature stop codon in the first exon of the gene and the paternal allele demonstrated 3- bp substitutions in a 33- bp sequence in exon 3. The 3 substitutions corresponded to the sequence in the lambda- 5/14.1 pseudogene 16.1 and resulted in an amino acid substitution at an invariant proline. When expressed in COS cells, the allele carrying the pseudogene sequence resulted in defective folding and secretion of mutant lambda- 5/14.1. These findings indicated that expression of the functional lambda- 5/14.1 is critical for B-cell development in the human

[29128]

[29129] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[29130] Kudo, A.; Melchers, F. : A second gene, Vpre- B in the lambda 5 locus of the mouse, which appears to be selectively expressed in pre- B lymphocytes. EMBO J. 6: 2267-2272, 1987. ; and

[29131] Mattei, M.- G.; Fumoux, F.; Roeckel, N.; Fougereau, M.; Schiff, C. : The human pre- B- specific lambda- like cluster is located in the 22q11.2- 22q12.3 region, distal to

the IgC- lambda locus.

[29132] Further studies establishing the function and utilities of IGLL1 are found in John Hopkins OMIM database record ID 146770, and in cited publications listed in Table 5, which are hereby incorporated by reference.Immunoglobulin lambda-like polypeptide 1 (IGLL1, Accession NP_064455.1) is another GAM189 target gene, herein designated TARGET GENE. IGLL1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by IGLL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IGLL1 BINDING SITE, designated SEQ ID:4573, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29133] Another function of GAM189 is therefore inhibition of Immunoglobulin lambda-like polypeptide 1 (IGLL1, Accession NP_064455.1), a gene which expressed only in pre-b- cells and a special b- cell line (which is surface ig negative). and therefore may be associated with Agammaglobulinemia, autosomal recessive. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment

of Agammaglobulinemia, autosomal recessive, and of other diseases and clinical conditions associated with IGLL1.

[29134] The function of IGLL1 has been established by previous studies. The VpreB (OMIM Ref. No. 605141) and lambda-5 genes encode the iota and omega polypeptide chains, respectively (Pillai and Baltimore, 1988), which associate with the immunoglobulin (Ig) mu chain to form a molecular complex that is expressed on the surface of pre- B cells. This complex presumably regulates Ig gene rearrangements in the early steps of B- cell differentiation. In the mouse the 2 genes are simultaneously expressed in pre- B cells, are only 4.6 kb apart, and belong to the same transcription unit. Mutations in the mu heavy chain are associated with complete failure of B- cell development in both humans and mice. In humans, the picture is that of autosomal recessive agammaglobulinemia (147020.0001 ff). Mutations in murine lambda- 5 result in a 'leaky' phenotype with detectable humoral responses. In evaluating patients with agammaglobulinemia and markedly reduced numbers of B cells, Minegishi et al. (1998) identified a boy with mutations on both alleles of the gene encoding lambda-5/14.1. The maternal allele carried a premature stop codon in the first exon of the gene and the paternal allele demonstrated 3- bp substitutions in a 33- bp sequence in exon 3. The 3 substitutions corresponded to the sequence

in the lambda- 5/14.1 pseudogene 16.1 and resulted in an amino acid substitution at an invariant proline. When expressed in COS cells, the allele carrying the pseudogene sequence resulted in defective folding and secretion of mutant lambda- 5/14.1. These findings indicated that expression of the functional lambda- 5/14.1 is critical for B-cell development in the human

[29135]

[29136] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[29137] Kudo, A.; Melchers, F. : A second gene, Vpre- B in the lambda 5 locus of the mouse, which appears to be selectively expressed in pre- B lymphocytes. EMBO J. 6: 2267-2272, 1987. ; and

[29138] Mattei, M.- G.; Fumoux, F.; Roeckel, N.; Fougereau, M.; Schiff, C. : The human pre- B- specific lambda- like cluster is located in the 22q11.2- 22q12.3 region, distal to the IgC- lambda locus.

[29139] Further studies establishing the function and utilities of IGLL1 are found in John Hopkins OMIM database record ID 146770, and in cited publications listed in Table 5, which are hereby incorporated by reference.Interleukin 11 (IL11,

Accession NP_000632.1) is another GAM189 target gene, herein designated TARGET GENE. IL11 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IL11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL11 BINDING SITE, designated SEQ ID:11544, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29140] Another function of GAM189 is therefore inhibition of Interleukin 11 (IL11, Accession NP_000632.1), a gene which stimulates the proliferation of hematopoietic stem cells and megakaryocyte progenitor cells and induces megakaryocyte maturation. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL11.

[29141] The function of IL11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM41.1.Interleukin 12 receptor, beta 1 (IL12RB1, Accession NP_714912.1) is another GAM189 target gene, herein designated TARGET GENE. IL12RB1 BINDING SITE is

a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by IL12RB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL12RB1 BINDING SITE, designated SEQ ID:10756, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29142] Another function of GAM189 is therefore inhibition of Interleukin 12 receptor, beta 1 (IL12RB1, Accession NP_714912.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL12RB1.

[29143] Interleukin 16 (lymphocyte chemoattractant factor) (IL16, Accession NP_757366.1) is another GAM189 target gene, herein designated TARGET GENE. IL16 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by IL16, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL16 BINDING SITE, designated SEQ ID:19554, to the nucleotide sequence of GAM189 RNA, herein designated

GAM RNA, also designated SEQ ID:246.

[29144] Another function of GAM189 is therefore inhibition of Interleukin 16 (lymphocyte chemoattractant factor) (IL16, Accession NP_757366.1), a gene which modulates T- cell activation. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL16.

[29145] The function of IL16 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM66.1.Interleukin 21 receptor (IL21R, Accession NP_851564.1) is another GAM189 target gene, herein designated TARGET GENE. IL21R BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by IL21R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL21R BINDING SITE, designated SEQ ID:498, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29146] Another function of GAM189 is therefore inhibition of Interleukin 21 receptor (IL21R, Accession NP_851564.1), a

gene which is involved in receptor mediated endocytosis and transduces the mitogenic signals of il- 2. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL21R.

[29147] The function of IL21R and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM69.2.Interleukin 21 receptor (IL21R, Accession NP_851565.1) is another GAM189 target gene, herein designated TARGET GENE. IL21R BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by IL21R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL21R BINDING SITE, designated SEQ ID:498, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29148] Another function of GAM189 is therefore inhibition of Interleukin 21 receptor (IL21R, Accession NP_851565.1), a gene which is involved in receptor mediated endocytosis and transduces the mitogenic signals of il- 2. Accordingly,

utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL21R.

[29149] The function of IL21R and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM69.2.Interleukin 21 receptor (IL21R, Accession NP_068570.1) is another GAM189 target gene, herein designated TARGET GENE. IL21R BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by IL21R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL21R BINDING SITE, designated SEQ ID:498, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29150] Another function of GAM189 is therefore inhibition of Interleukin 21 receptor (IL21R, Accession NP_068570.1), a gene which is involved in receptor mediated endocytosis and transduces the mitogenic signals of il- 2. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with IL21R.

[29151] The function of IL21R and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM69.2.Interleukin 28 receptor, alpha (IL28RA, Accession NP_775087.1) is another GAM189 target gene, herein designated TARGET GENE. IL28RA BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by IL28RA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL28RA BINDING SITE, designated SEQ ID:7046, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29152] Another function of GAM189 is therefore inhibition of Interleukin 28 receptor, alpha (IL28RA, Accession NP_775087.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL28RA.

[29153] Interleukin 28 receptor, alpha (IL28RA, Accession NP_734464.1) is another GAM189 target gene, herein designated TARGET GENE. IL28RA BINDING SITE is a target

binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by IL28RA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL28RA BINDING SITE, designated SEQ ID:7046, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29154] Another function of GAM189 is therefore inhibition of Interleukin 28 receptor, alpha (IL28RA, Accession NP_734464.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL28RA.

[29155] Interleukin 28 receptor, alpha (IL28RA, Accession NP_775088.1) is another GAM189 target gene, herein designated TARGET GENE. IL28RA BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by IL28RA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL28RA BINDING SITE, designated SEQ ID:7046, to the nucleotide sequence of GAM189 RNA, herein designated

GAM RNA, also designated SEQ ID:246.

[29156] Another function of GAM189 is therefore inhibition of Interleukin 28 receptor, alpha (IL28RA, Accession NP_775088.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL28RA.

[29157] Interleukin 5 receptor, alpha (IL5RA, Accession NP_783853.1) is another GAM189 target gene, herein designated TARGET GENE. IL5RA BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by IL5RA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL5RA BINDING SITE, designated SEQ ID:8557, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29158] Another function of GAM189 is therefore inhibition of Interleukin 5 receptor, alpha (IL5RA, Accession NP_783853.1), a gene which is the receptor for interleukin- 5. the alpha chain binds to il- 5. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

IL5RA.

[29159] The function of IL5RA has been established by previous studies. Tavernier et al. (1991) isolated cDNA clones encoding 2 receptor proteins involved in the binding of human interleukin- 5 (IL5; 147850). The major transcript of this receptor gene, as analyzed in both eosinophilic sublines of human promyelocytic cells and in eosinophilic myelocytes grown from cord blood, encodes a secreted form of this receptor. A second component of the receptor was found to be identical to the beta chain of the human granulocyte- macrophage colony- stimulating factor high affinity receptor (CSF2RB; 138981). The finding that IL5 and CSF2 share a receptor subunit provides a molecular basis for the observation that these cytokines can partially interfere with each other's binding and have highly overlapping biologic activities on eosinophils. The common use of the same receptor component is reminiscent of the structural relatedness of IL3 (OMIM Ref. No. 147740), IL5, and GM- CSF (CSF2; 138960). The homology at the C terminus may indicate a related binding domain. The common origin of all 3 cytokines is also suggested by their clustered chromosomal localization and by the structure of their genes. Using a yeast 2- hybrid screen of a granu-

locyte cDNA library with the cytoplasmic domain of IL5RA as bait, Geijsen et al. (2001) identified an interaction of IL5RA with syntenin (SDCBP; 602217). GST pull- down, BI-Acore, coimmunoprecipitation, and deletion mutant analyses confirmed an association of syntenin with the last 15 C- terminal residues of IL5RA; syntenin did not interact with CFS2RB. Within this 15- residue stretch of IL5RA, the C- terminal phenylalanine is critical. Deletion of either of the 2 tandem PDZ domains of syntenin, which are known to interact with C- terminal peptide sequences, abrogated the IL5RA- syntenin interaction. A second 2- hybrid screen identified the mouse transcriptional factor Sox4 (OMIM Ref. No. 184430) as a binding partner for syntenin but not for IL5RA. The syntenin- Sox4 interaction occurs outside of the PDZ domains of syntenin. Luciferase reporter analysis and fluorescence microscopy showed that IL5, but not IL3, induces cytoplasmic and nuclear expression of syntenin and, in a syntenin- and cytoplasmic IL5RA- dependent manner, of Sox4. Geijsen et al. (2001) concluded that syntenin acts as an adaptor molecule in the IL5RA- mediated activation of SOX4. They also noted that mice lacking either Il5ra or Sox4 have defects in B-cell development

[29160]

[29161] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[29162] Tavernier, J.; Devos, R.; Cornelis, S.; Tuypens, T.; Van der Heyden, J.; Fiers, W.; Plaetinck, G. : A human high affinity interleukin- 5 receptor (IL5R) is composed of an IL5- specific alpha chain and a beta chain shared with the receptor for GM- CSF. Cell 66: 1175- 1184, 1991. ; and

Geijsen et al. (2001) concluded that syntenin acts as an adaptor molecule in the IL5RA- mediated activation of SOX4. They also noted that mice lacking either Il5ra or Sox4 have defects in B-cell development

[29167]

[29168] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[29169] Tavernier, J.; Devos, R.; Cornelis, S.; Tuypens, T.; Van der Heyden, J.; Fiers, W.; Plaetinck, G. : A human high affinity interleukin- 5 receptor (IL5R) is composed of an IL5- specific alpha chain and a beta chain shared with the receptor for GM- CSF. Cell 66: 1175- 1184, 1991. ; and

[29170] Geijsen, N.; Uings, I. J.; Pals, C.; Armstrong, J.; McKinnon, M.; Raaijmakers, J. A. M.; Lammers, J.- W. J.; Koenderman, L.; Coffer, P. J. : Cytokine- specific transcriptional regulation t.

[29171] Further studies establishing the function and utilities of IL5RA are found in John Hopkins OMIM database record ID 147851, and in cited publications listed in Table 5, which are hereby incorporated by reference.Interleukin enhancer binding factor 3, 90kda (ILF3, Accession NP_036350.2) is another GAM189 target gene, herein designated TARGET GENE. ILF3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ILF3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ILF3 BINDING SITE, designated SEQ ID:17287, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29172] Another function of GAM189 is therefore inhibition of Interleukin enhancer binding factor 3, 90kda (ILF3, Accession NP_036350.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ILF3.

[29173] IMPACT (Accession NP_060909.1) is another GAM189 target gene, herein designated TARGET GENE. IMPACT BINDING SITE is a target binding site found in the 3` untrans-

lated region of mRNA encoded by IMPACT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IMPACT BINDING SITE, designated SEQ ID:8975, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29174] Another function of GAM189 is therefore inhibition of IMPACT (Accession NP_060909.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IMPACT.

[29175] INHBE (Accession NP_113667.1) is another GAM189 target gene, herein designated TARGET GENE. INHBE BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by INHBE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of INHBE BINDING SITE, designated SEQ ID:16283, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29176] Another function of GAM189 is therefore inhibition of INHBE (Accession NP_113667.1) . Accordingly, utilities of

GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INHBE.

[29177] Indolethylamine n-methyltransferase (INMT, Accession NP_006765.3) is another GAM189 target gene, herein designated TARGET GENE. INMT BINDING SITE1 and INMT BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by INMT, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of INMT BINDING SITE1 and INMT BINDING SITE2, designated SEQ ID:9149 and SEQ ID:11523 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29178] Another function of GAM189 is therefore inhibition of Indolethylamine n-methyltransferase (INMT, Accession NP_006765.3) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INMT.

[29179] Interferon regulatory factor 4 (IRF4, Accession NP_002451.1) is another GAM189 target gene, herein designated TARGET GENE. IRF4 BINDING SITE1 and IRF4 BINDING SITE2 are target binding sites found in untrans-

lated regions of mRNA encoded by IRF4, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IRF4 BINDING SITE1 and IRF4 BINDING SITE2, designated SEQ ID:2698 and SEQ ID:1517 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29180] Another function of GAM189 is therefore inhibition of Interferon regulatory factor 4 (IRF4, Accession NP_002451.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRF4.

[29181] Integrin, alpha x (antigen cd11c (p150), alpha polypeptide) (ITGAX, Accession NP_000878.1) is another GAM189 target gene, herein designated TARGET GENE. ITGAX BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ITGAX, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ITGAX BINDING SITE, designated SEQ ID:559, to the nucleotide sequence of GAM189 RNA, herein designated

GAM RNA, also designated SEQ ID:246.

[29182] Another function of GAM189 is therefore inhibition of Integrin, alpha x (antigen cd11c (p150), alpha polypeptide) (ITGAX, Accession NP_000878.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGAX.

[29183] Janus kinase 3 (a protein tyrosine kinase, leukocyte) (JAK3, Accession NP_000206.1) is another GAM189 target gene, herein designated TARGET GENE. JAK3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by JAK3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of JAK3 BINDING SITE, designated SEQ ID:18060, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29184] Another function of GAM189 is therefore inhibition of Janus kinase 3 (a protein tyrosine kinase, leukocyte) (JAK3, Accession NP_000206.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JAK3.

[29185] JM11 (Accession NP_296375.1) is another GAM189 target

gene, herein designated TARGET GENE. JM11 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by JM11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of JM11 BINDING SITE, designated SEQ ID:10197, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29186] Another function of GAM189 is therefore inhibition of JM11 (Accession NP_296375.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JM11.

[29187] Jerky homolog (mouse) (JRK, Accession NP_003715.1) is another GAM189 target gene, herein designated TARGET GENE. JRK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by JRK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of JRK BINDING SITE, designated SEQ ID:3927, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29188] Another function of GAM189 is therefore inhibition of Jerky homolog (mouse) (JRK, Accession NP_003715.1), a gene which might function as a DNA- binding protein. and therefore may be associated with Absence epilepsy. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Absence epilepsy, and of other diseases and clinical conditions associated with JRK.

[29189] The function of JRK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM65.2.Potassium inwardly-rectifying channel, subfamily j, member 11 (KCNJ11, Accession NP_000516.2) is another GAM189 target gene, herein designated TARGET GENE. KCNJ11 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KCNJ11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNJ11 BINDING SITE, designated SEQ ID:15049, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29190] Another function of GAM189 is therefore inhibition of

Potassium inwardly-rectifying channel, subfamily j, member 11 (KCNJ11, Accession NP_000516.2), a gene which is controlled by g proteins. inward rectifier k+ channels are characterized by a greater tendancy to allow potassium to flow into the cell rather than out of it. and therefore is associated with Persistent hyperinsulinemic hypoglycemia of infancy. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Persistent hyperinsulinemic hypoglycemia of infancy, and of other diseases and clinical conditions associated with KCNJ11.

[29191] The function of KCNJ11 has been established by previous studies. ATP- sensitive potassium currents, I(KATP), were discovered in cardiac muscle and later found in pancreatic beta cells, pituitary tissue, skeletal muscle, brain, and vascular and nonvascular smooth muscle. I(KATP) functions in secretion and muscle contraction by coupling metabolic activity to membrane potential. In pancreatic beta cells, ATP- potassium channels are crucial for the regulation of glucose- induced insulin secretion and are the target for the sulfonylureas, oral hypoglycemic agents widely used in the treatment of noninsulin- dependent diabetes mellitus (NIDDM; 125853), and for diazoxide, a potassium channel opener. The sulfonylurea receptor SUR

(OMIM Ref. No. 600509) is a member of the ATP- binding cassette superfamily with multiple transmembrane- spanning domains and 2 potential nucleotide- binding folds. Truncation of SUR that removes the second nucleotide-binding fold causes familial persistent hyperinsulinemic hypoglycemia of infancy (see, OMIM Ref. No., for example, 600509.0001), a rare disorder of glucose homeostasis characterized by unregulated insulin secretion despite severe hypoglycemia. Although these observations imply that SUR is closely associated with, or even a subunit of, K(ATP) channels, expression of SUR alone had not produced a measurable I(KATP). Inagaki et al. (1995) cloned a member of the inwardly rectifying potassium channel family, which they called BIR or Kir6.2, in the nomenclature of Chandy and Gutman (1993). The channel was expressed in large amounts in rat pancreatic islets and glucose- responsive insulin- secreting cell lines. The sequence showed a single open reading frame encoding a 390- amino acid protein with 2 putative transmembrane segments. The mouse homolog also had a single open reading frame encoding a 390- amino acid protein with 96% amino acid identity with human BIR, thus confirming that the gene encoding human BIR is intronless in the

protein- coding region. Several other genes encoding inward rectifiers lack introns. This gene is also symbolized KCNJ11.

[29192] Animal model experiments lend further support to the function of KCNJ11. ATP- sensitive potassium channels are activated by various metabolic stresses, including hypoxia. The substantia nigra pars reticulata, the area with the highest expression of ATP- sensitive potassium channels in the brain, plays a pivotal role in the control of seizures. Yamada et al. (2001) studied mutant mice lacking the Kir6.2 subunit of ATP- sensitive potassium channels and found that they were susceptible to generalized seizures after brief hypoxia. In normal mice, the substantia nigra pars reticulata neuron activity was inactivated during hypoxia by the opening of the postsynaptic ATP-sensitive potassium channels, whereas in knockout mice, the activity of these neurons was enhanced. ATP- sensitive potassium channels exert a depressant effect on substantia nigra pars reticulata neuronal activity during hypoxia and may be involved in the nigral protection mechanism against generalized seizures

[29193] It is appreciated that the abovementioned animal model for KCNJ11 is acknowledged by those skilled in the art as

a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[29194] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[29195] Thomas, P. M.; Cote, G. J.; Hallman, D. M.; Mathew, P. M. : Homozygosity mapping, to chromosome 11p, of the gene for familial persistent hyperinsulinemic hypoglycemia of infancy. Am. J. Hum. Genet. 56: 416- 421, 1995. ; and

[29196] Yamada, K.; Ji, J. J.; Yuan, H.; Miki, T.; Sata, S.; Horimoto, N.; Shimizu, T.; Seino, S.; Inagaki, N. : Protective role of ATP- sensitive potassium channels in hypoxia- induced generalize.

[29197] Further studies establishing the function and utilities of KCNJ11 are found in John Hopkins OMIM database record ID 600937, and in cited publications listed in Table 5, which are hereby incorporated by reference.Potassium inwardly-rectifying channel, subfamily j, member 16 (KCNJ16, Accession NP_061128.1) is another GAM189 target gene, herein designated TARGET GENE. KCNJ16 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KCNJ16, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNJ16 BINDING SITE, designated SEQ ID:2456, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29198] Another function of GAM189 is therefore inhibition of Potassium inwardly-rectifying channel, subfamily j, member 16 (KCNJ16, Accession NP_061128.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ16.

[29199] Potassium inwardly-rectifying channel, subfamily j, member 16 (KCNJ16, Accession NP_733937.1) is another GAM189 target gene, herein designated TARGET GENE. KCNJ16 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KCNJ16, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNJ16 BINDING SITE, designated SEQ ID:2456, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29200] Another function of GAM189 is therefore inhibition of Potassium inwardly-rectifying channel, subfamily j, member 16 (KCNJ16, Accession NP_733937.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ16.

[29201] Potassium inwardly-rectifying channel, subfamily j, member 16 (KCNJ16, Accession NP_733938.1) is another GAM189 target gene, herein designated TARGET GENE. KCNJ16 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KCNJ16, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNJ16 BINDING SITE, designated SEQ ID:2456, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29202] Another function of GAM189 is therefore inhibition of Potassium inwardly-rectifying channel, subfamily j, member 16 (KCNJ16, Accession NP_733938.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with KCNJ16.

[29203] KENAE (Accession NP_789786.1) is another GAM189 target gene, herein designated TARGET GENE. KENAE BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KENAE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KENAE BINDING SITE, designated SEQ ID:14862, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29204] Another function of GAM189 is therefore inhibition of KENAE (Accession NP_789786.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KENAE.

[29205] KIAA0063 (Accession NP_055691.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA0063 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0063, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0063 BINDING SITE, designated SEQ ID:5884, to the

nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29206] Another function of GAM189 is therefore inhibition of KIAA0063 (Accession NP_055691.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0063.

[29207] KIAA0082 (Accession NP_055865.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA0082 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0082, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0082 BINDING SITE, designated SEQ ID:18751, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29208] Another function of GAM189 is therefore inhibition of KIAA0082 (Accession NP_055865.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0082.

[29209] KIAA0087 (Accession NP_055584.1) is another GAM189

target gene, herein designated TARGET GENE. KIAA0087 BINDING SITE1 and KIAA0087 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA0087, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0087 BINDING SITE1 and KIAA0087 BINDING SITE2, designated SEQ ID:10179 and SEQ ID:7956 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29210] Another function of GAM189 is therefore inhibition of KIAA0087 (Accession NP_055584.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0087.

[29211] KIAA0117 (Accession XP_290939.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA0117 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0117, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

KIAA0117 BINDING SITE, designated SEQ ID:9255, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29212] Another function of GAM189 is therefore inhibition of KIAA0117 (Accession XP_290939.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0117.

[29213] KIAA0182 (Accession XP_050495.4) is another GAM189 target gene, herein designated TARGET GENE. KIAA0182 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0182, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0182 BINDING SITE, designated SEQ ID:2218, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29214] Another function of GAM189 is therefore inhibition of KIAA0182 (Accession XP_050495.4) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0182.

[29215] KIAA0186 (Accession NP_066545.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA0186 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0186, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0186 BINDING SITE, designated SEQ ID:2625, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29216] Another function of GAM189 is therefore inhibition of KIAA0186 (Accession NP_066545.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0186.

[29217] KIAA0205 (Accession NP_055688.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA0205 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0205, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0205 BINDING SITE, designated SEQ ID:3429, to the

nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29218] Another function of GAM189 is therefore inhibition of KIAA0205 (Accession NP_055688.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0205.

[29219] KIAA0237 (Accession NP_055562.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA0237 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0237, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0237 BINDING SITE, designated SEQ ID:17386, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29220] Another function of GAM189 is therefore inhibition of KIAA0237 (Accession NP_055562.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0237.

[29221] KIAA0295 (Accession XP_042833.2) is another GAM189

target gene, herein designated TARGET GENE. KIAA0295 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0295, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0295 BINDING SITE, designated SEQ ID:10742, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29222] Another function of GAM189 is therefore inhibition of KIAA0295 (Accession XP_042833.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0295.

[29223] KIAA0435 (Accession NP_055616.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA0435 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0435, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0435 BINDING SITE, designated SEQ ID:5041, to the nucleotide sequence of GAM189 RNA, herein designated

GAM RNA, also designated SEQ ID:246.

[29224] Another function of GAM189 is therefore inhibition of KIAA0435 (Accession NP_055616.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0435.

[29225] KIAA0446 (Accession XP_044155.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA0446 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0446, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0446 BINDING SITE, designated SEQ ID:1475, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29226] Another function of GAM189 is therefore inhibition of KIAA0446 (Accession XP_044155.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0446.

[29227] KIAA0459 (Accession XP_027862.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA0459

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0459, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0459 BINDING SITE, designated SEQ ID:4531, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29228] Another function of GAM189 is therefore inhibition of KIAA0459 (Accession XP_027862.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0459.

[29229] KIAA0469 (Accession NP_055666.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA0469 BINDING SITE1 and KIAA0469 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA0469, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0469 BINDING SITE1 and KIAA0469 BINDING SITE2, designated SEQ ID:9147 and SEQ ID:9493 respectively, to the nucleotide sequence of

GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29230] Another function of GAM189 is therefore inhibition of KIAA0469 (Accession NP_055666.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0469.

[29231] KIAA0475 (Accession NP_055679.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA0475 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0475, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:16940, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29232] Another function of GAM189 is therefore inhibition of KIAA0475 (Accession NP_055679.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475.

[29233] KIAA0493 (Accession XP_034717.1) is another GAM189

target gene, herein designated TARGET GENE. KIAA0493 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0493, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0493 BINDING SITE, designated SEQ ID:17206, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29234] Another function of GAM189 is therefore inhibition of KIAA0493 (Accession XP_034717.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0493.

[29235] KIAA0495 (Accession XP_031397.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA0495 BINDING SITE1 and KIAA0495 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA0495, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0495 BINDING SITE1 and KIAA0495 BINDING SITE2, designated SEQ ID:14759 and

SEQ ID:5442 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29236] Another function of GAM189 is therefore inhibition of KIAA0495 (Accession XP_031397.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0495.

[29237] KIAA0513 (Accession NP_055547.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA0513 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0513, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0513 BINDING SITE, designated SEQ ID:3931, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29238] Another function of GAM189 is therefore inhibition of KIAA0513 (Accession NP_055547.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0513.

[29239] KIAA0527 (Accession XP_171054.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA0527 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0527, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0527 BINDING SITE, designated SEQ ID:19745, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29240] Another function of GAM189 is therefore inhibition of KIAA0527 (Accession XP_171054.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0527.

[29241] KIAA0532 (Accession XP_047659.6) is another GAM189 target gene, herein designated TARGET GENE. KIAA0532 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0532, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0532 BINDING SITE, designated SEQ ID:12455, to the

nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29242] Another function of GAM189 is therefore inhibition of KIAA0532 (Accession XP_047659.6) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0532.

[29243] KIAA0555 (Accession NP_055605.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA0555 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0555, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0555 BINDING SITE, designated SEQ ID:5555, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29244] Another function of GAM189 is therefore inhibition of KIAA0555 (Accession NP_055605.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0555.

[29245] KIAA0561 (Accession XP_038150.2) is another GAM189

target gene, herein designated TARGET GENE. KIAA0561 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0561, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0561 BINDING SITE, designated SEQ ID:9629, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29246] Another function of GAM189 is therefore inhibition of KIAA0561 (Accession XP_038150.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0561.

[29247] KIAA0562 (Accession NP_055519.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA0562 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0562, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0562 BINDING SITE, designated SEQ ID:16544, to the nucleotide sequence of GAM189 RNA, herein designated

GAM RNA, also designated SEQ ID:246.

[29248] Another function of GAM189 is therefore inhibition of KIAA0562 (Accession NP_055519.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0562.

[29249] KIAA0563 (Accession NP_055649.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA0563 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0563, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0563 BINDING SITE, designated SEQ ID:16377, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29250] Another function of GAM189 is therefore inhibition of KIAA0563 (Accession NP_055649.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0563.

[29251] KIAA0682 (Accession NP_055667.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA0682

BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KIAA0682, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0682 BINDING SITE, designated SEQ ID:6522, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29252] Another function of GAM189 is therefore inhibition of KIAA0682 (Accession NP_055667.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0682.

[29253] KIAA0804 (Accession XP_291080.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA0804 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0804, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0804 BINDING SITE, designated SEQ ID:14656, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29254] Another function of GAM189 is therefore inhibition of KIAA0804 (Accession XP_291080.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0804.

[29255] KIAA0831 (Accession NP_055739.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA0831 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0831, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0831 BINDING SITE, designated SEQ ID:3260, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29256] Another function of GAM189 is therefore inhibition of KIAA0831 (Accession NP_055739.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0831.

[29257] KIAA0841 (Accession XP_049237.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA0841 BINDING SITE1 and KIAA0841 BINDING SITE2 are target

binding sites found in untranslated regions of mRNA encoded by KIAA0841, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0841 BINDING SITE1 and KIAA0841 BINDING SITE2, designated SEQ ID:8185 and SEQ ID:5490 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29258] Another function of GAM189 is therefore inhibition of KIAA0841 (Accession XP_049237.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0841.

[29259] KIAA0861 (Accession NP_055893.2) is another GAM189 target gene, herein designated TARGET GENE. KIAA0861 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0861, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0861 BINDING SITE, designated SEQ ID:2153, to the nucleotide sequence of GAM189 RNA, herein designated

GAM RNA, also designated SEQ ID:246.

[29260] Another function of GAM189 is therefore inhibition of KIAA0861 (Accession NP_055893.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0861.

[29261] KIAA0889 (Accession NP_056192.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA0889 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KIAA0889, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0889 BINDING SITE, designated SEQ ID:13271, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29262] Another function of GAM189 is therefore inhibition of KIAA0889 (Accession NP_056192.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0889.

[29263] KIAA0924 (Accession NP_055712.1) is another GAM189

target gene, herein designated TARGET GENE. KIAA0924 BINDING SITE1 and KIAA0924 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA0924, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0924 BINDING SITE1 and KIAA0924 BINDING SITE2, designated SEQ ID:13297 and SEQ ID:7655 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29264] Another function of GAM189 is therefore inhibition of KIAA0924 (Accession NP_055712.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0924.

[29265] KIAA0931 (Accession XP_041191.2) is another GAM189 target gene, herein designated TARGET GENE. KIAA0931 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0931, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

KIAA0931 BINDING SITE, designated SEQ ID:14272, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29266] Another function of GAM189 is therefore inhibition of KIAA0931 (Accession XP_041191.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0931.

[29267] KIAA0935 (Accession XP_052620.6) is another GAM189 target gene, herein designated TARGET GENE. KIAA0935 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0935, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0935 BINDING SITE, designated SEQ ID:11958, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29268] Another function of GAM189 is therefore inhibition of KIAA0935 (Accession XP_052620.6) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0935.

[29269] KIAA0962 (Accession XP_290942.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA0962 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0962, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0962 BINDING SITE, designated SEQ ID:8976, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29270] Another function of GAM189 is therefore inhibition of KIAA0962 (Accession XP_290942.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0962.

[29271] KIAA1002 (Accession XP_290584.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA1002 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1002, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1002 BINDING SITE, designated SEQ ID:12518, to the

nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29272] Another function of GAM189 is therefore inhibition of KIAA1002 (Accession XP_290584.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1002.

[29273] KIAA1040 (Accession XP_051091.3) is another GAM189 target gene, herein designated TARGET GENE. KIAA1040 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1040, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1040 BINDING SITE, designated SEQ ID:11846, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29274] Another function of GAM189 is therefore inhibition of KIAA1040 (Accession XP_051091.3) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1040.

[29275] KIAA1041 (Accession NP_055762.1) is another GAM189

target gene, herein designated TARGET GENE. KIAA1041 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1041, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1041 BINDING SITE, designated SEQ ID:3653, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29276] Another function of GAM189 is therefore inhibition of KIAA1041 (Accession NP_055762.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1041.

[29277] KIAA1054 (Accession XP_043493.5) is another GAM189 target gene, herein designated TARGET GENE. KIAA1054 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1054, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1054 BINDING SITE, designated SEQ ID:14832, to the nucleotide sequence of GAM189 RNA, herein designated

GAM RNA, also designated SEQ ID:246.

[29278] Another function of GAM189 is therefore inhibition of KIAA1054 (Accession XP_043493.5) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1054.

[29279] KIAA1115 (Accession NP_055746.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA1115 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1115, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1115 BINDING SITE, designated SEQ ID:9842, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29280] Another function of GAM189 is therefore inhibition of KIAA1115 (Accession NP_055746.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1115.

[29281] KIAA1128 (Accession NP_061872.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA1128

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1128, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1128 BINDING SITE, designated SEQ ID:5783, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29282] Another function of GAM189 is therefore inhibition of KIAA1128 (Accession NP_061872.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1128.

[29283] KIAA1143 (Accession XP_044014.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA1143 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1143, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1143 BINDING SITE, designated SEQ ID:7385, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29284] Another function of GAM189 is therefore inhibition of KIAA1143 (Accession XP_044014.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1143.

[29285] KIAA1145 (Accession NP_065749.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA1145 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1145, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1145 BINDING SITE, designated SEQ ID:17532, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29286] Another function of GAM189 is therefore inhibition of KIAA1145 (Accession NP_065749.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1145.

[29287] KIAA1155 (Accession XP_030864.2) is another GAM189 target gene, herein designated TARGET GENE. KIAA1155 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by KIAA1155, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1155 BINDING SITE, designated SEQ ID:2664, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29288] Another function of GAM189 is therefore inhibition of KIAA1155 (Accession XP_030864.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1155.

[29289] KIAA1170 (Accession XP_045907.2) is another GAM189 target gene, herein designated TARGET GENE. KIAA1170 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1170, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1170 BINDING SITE, designated SEQ ID:10162, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29290] Another function of GAM189 is therefore inhibition of

KIAA1170 (Accession XP_045907.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1170.

[29291] KIAA1185 (Accession NP_065761.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA1185 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1185, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1185 BINDING SITE, designated SEQ ID:5755, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29292] Another function of GAM189 is therefore inhibition of KIAA1185 (Accession NP_065761.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1185.

[29293] KIAA1193 (Accession XP_041843.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA1193 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1193, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1193 BINDING SITE, designated SEQ ID:17517, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29294] Another function of GAM189 is therefore inhibition of KIAA1193 (Accession XP_041843.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1193.

[29295] KIAA1198 (Accession NP_065765.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA1198 BINDING SITE1 through KIAA1198 BINDING SITE5 are target binding sites found in untranslated regions of mRNA encoded by KIAA1198, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1198 BINDING SITE1 through KIAA1198 BINDING SITE5, designated SEQ ID:13749, SEQ ID:16471, SEQ ID:12389, SEQ ID:16088 and SEQ ID:12478 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA,

also designated SEQ ID:246.

[29296] Another function of GAM189 is therefore inhibition of KIAA1198 (Accession NP_065765.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1198.

[29297] KIAA1209 (Accession XP_027307.2) is another GAM189 target gene, herein designated TARGET GENE. KIAA1209 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1209, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1209 BINDING SITE, designated SEQ ID:8271, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29298] Another function of GAM189 is therefore inhibition of KIAA1209 (Accession XP_027307.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1209.

[29299] KIAA1210 (Accession XP_172801.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA1210

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1210, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1210 BINDING SITE, designated SEQ ID:9144, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29300] Another function of GAM189 is therefore inhibition of KIAA1210 (Accession XP_172801.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1210.

[29301] KIAA1257 (Accession XP_031577.2) is another GAM189 target gene, herein designated TARGET GENE. KIAA1257 BINDING SITE1 and KIAA1257 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA1257, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1257 BINDING SITE1 and KIAA1257 BINDING SITE2, designated SEQ ID:11523 and SEQ ID:9032 respectively, to the nucleotide sequence of

GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29302] Another function of GAM189 is therefore inhibition of KIAA1257 (Accession XP_031577.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1257.

[29303] KIAA1268 (Accession XP_291055.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA1268 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1268, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1268 BINDING SITE, designated SEQ ID:3236, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29304] Another function of GAM189 is therefore inhibition of KIAA1268 (Accession XP_291055.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1268.

[29305] KIAA1273 (Accession XP_300760.1) is another GAM189

target gene, herein designated TARGET GENE. KIAA1273 BINDING SITE1 and KIAA1273 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA1273, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1273 BINDING SITE1 and KIAA1273 BINDING SITE2, designated SEQ ID:7374 and SEQ ID:4555 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29306] Another function of GAM189 is therefore inhibition of KIAA1273 (Accession XP_300760.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1273.

[29307] KIAA1276 (Accession XP_039169.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA1276 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1276, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

KIAA1276 BINDING SITE, designated SEQ ID:1905, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29308] Another function of GAM189 is therefore inhibition of KIAA1276 (Accession XP_039169.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1276.

[29309] KIAA1287 (Accession NP_065799.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA1287 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1287, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1287 BINDING SITE, designated SEQ ID:9573, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29310] Another function of GAM189 is therefore inhibition of KIAA1287 (Accession NP_065799.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1287.

[29311] KIAA1393 (Accession XP_050793.2) is another GAM189 target gene, herein designated TARGET GENE. KIAA1393 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1393, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1393 BINDING SITE, designated SEQ ID:10123, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29312] Another function of GAM189 is therefore inhibition of KIAA1393 (Accession XP_050793.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1393.

[29313] KIAA1443 (Accession NP_065885.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA1443 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1443, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1443 BINDING SITE, designated SEQ ID:15171, to the

nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29314] Another function of GAM189 is therefore inhibition of KIAA1443 (Accession NP_065885.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1443.

[29315] KIAA1456 (Accession XP_040100.3) is another GAM189 target gene, herein designated TARGET GENE. KIAA1456 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1456, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1456 BINDING SITE, designated SEQ ID:5529, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29316] Another function of GAM189 is therefore inhibition of KIAA1456 (Accession XP_040100.3) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1456.

[29317] KIAA1463 (Accession XP_051160.2) is another GAM189

target gene, herein designated TARGET GENE. KIAA1463 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1463, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1463 BINDING SITE, designated SEQ ID:1667, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29318] Another function of GAM189 is therefore inhibition of KIAA1463 (Accession XP_051160.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1463.

[29319] KIAA1465 (Accession XP_027396.4) is another GAM189 target gene, herein designated TARGET GENE. KIAA1465 BINDING SITE1 and KIAA1465 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA1465, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1465 BINDING SITE1 and KIAA1465 BINDING SITE2, designated SEQ ID:18838 and

SEQ ID:18992 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29320] Another function of GAM189 is therefore inhibition of KIAA1465 (Accession XP_027396.4) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1465.

[29321] KIAA1493 (Accession XP_034415.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA1493 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1493, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1493 BINDING SITE, designated SEQ ID:15045, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29322] Another function of GAM189 is therefore inhibition of KIAA1493 (Accession XP_034415.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1493.

[29323] KIAA1508 (Accession XP_290952.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA1508 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1508, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1508 BINDING SITE, designated SEQ ID:8820, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29324] Another function of GAM189 is therefore inhibition of KIAA1508 (Accession XP_290952.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1508.

[29325] KIAA1518 (Accession XP_170889.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA1518 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KIAA1518, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1518 BINDING SITE, designated

SEQ ID:13383, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29326] Another function of GAM189 is therefore inhibition of KIAA1518 (Accession XP_170889.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1518.

[29327] KIAA1530 (Accession XP_042661.5) is another GAM189 target gene, herein designated TARGET GENE. KIAA1530 BINDING SITE1 and KIAA1530 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA1530, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1530 BINDING SITE1 and KIAA1530 BINDING SITE2, designated SEQ ID:4028 and SEQ ID:15284 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29328] Another function of GAM189 is therefore inhibition of KIAA1530 (Accession XP_042661.5) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1530.

[29329] KIAA1550 (Accession XP_039393.3) is another GAM189 target gene, herein designated TARGET GENE. KIAA1550 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1550, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1550 BINDING SITE, designated SEQ ID:3790, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29330] Another function of GAM189 is therefore inhibition of KIAA1550 (Accession XP_039393.3) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1550.

[29331] KIAA1559 (Accession XP_054472.2) is another GAM189 target gene, herein designated TARGET GENE. KIAA1559 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1559, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of KIAA1559 BINDING SITE, designated SEQ ID:4029, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29332] Another function of GAM189 is therefore inhibition of KIAA1559 (Accession XP_054472.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1559.

[29333] KIAA1571 (Accession XP_027744.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA1571 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1571, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1571 BINDING SITE, designated SEQ ID:14154, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29334] Another function of GAM189 is therefore inhibition of KIAA1571 (Accession XP_027744.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1571.

[29335] KIAA1615 (Accession NP_066002.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA1615 BINDING SITE1 and KIAA1615 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA1615, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1615 BINDING SITE1 and KIAA1615 BINDING SITE2, designated SEQ ID:10111 and SEQ ID:8549 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29336] Another function of GAM189 is therefore inhibition of KIAA1615 (Accession NP_066002.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1615.

[29337] KIAA1671 (Accession XP_037809.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA1671 BINDING SITE1 and KIAA1671 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA1671, corresponding to target binding sites

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1671 BINDING SITE1 and KIAA1671 BINDING SITE2, designated SEQ ID:17191 and SEQ ID:7194 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29338] Another function of GAM189 is therefore inhibition of KIAA1671 (Accession XP_037809.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1671.

[29339] KIAA1712 (Accession XP_041497.2) is another GAM189 target gene, herein designated TARGET GENE. KIAA1712 BINDING SITE1 and KIAA1712 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by KIAA1712, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1712 BINDING SITE1 and KIAA1712 BINDING SITE2, designated SEQ ID:1142 and SEQ ID:14165 respectively, to the nucleotide sequence of GAM189 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:246.

[29340] Another function of GAM189 is therefore inhibition of KIAA1712 (Accession XP_041497.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1712.

[29341] KIAA1712 (Accession XP_041497.2) is another GAM189 target gene, herein designated TARGET GENE. KIAA1712 BINDING SITE1 and KIAA1712 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by KIAA1712, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1712 BINDING SITE1 and KIAA1712 BINDING SITE2, designated SEQ ID:14165 and SEQ ID:1142 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29342] Another function of GAM189 is therefore inhibition of KIAA1712 (Accession XP_041497.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1712.

[29343] KIAA1724 (Accession XP_040280.2) is another GAM189 target gene, herein designated TARGET GENE. KIAA1724 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1724, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1724 BINDING SITE, designated SEQ ID:14630, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29344] Another function of GAM189 is therefore inhibition of KIAA1724 (Accession XP_040280.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1724.

[29345] KIAA1737 (Accession NP_219494.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA1737 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1737, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1737 BINDING SITE, designated SEQ ID:10602, to the

nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29346] Another function of GAM189 is therefore inhibition of KIAA1737 (Accession NP_219494.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1737.

[29347] KIAA1775 (Accession NP_149091.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA1775 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1775, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1775 BINDING SITE, designated SEQ ID:1618, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29348] Another function of GAM189 is therefore inhibition of KIAA1775 (Accession NP_149091.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1775.

[29349] KIAA1784 (Accession NP_115820.1) is another GAM189

target gene, herein designated TARGET GENE. KIAA1784 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1784, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1784 BINDING SITE, designated SEQ ID:11058, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29350] Another function of GAM189 is therefore inhibition of KIAA1784 (Accession NP_115820.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1784.

[29351] KIAA1822 (Accession XP_041566.2) is another GAM189 target gene, herein designated TARGET GENE. KIAA1822 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1822, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1822 BINDING SITE, designated SEQ ID:10095, to the nucleotide sequence of GAM189 RNA, herein designated

GAM RNA, also designated SEQ ID:246.

[29352] Another function of GAM189 is therefore inhibition of KIAA1822 (Accession XP_041566.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1822.

[29353] KIAA1827 (Accession XP_290834.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA1827 BINDING SITE1 and KIAA1827 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA1827, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1827 BINDING SITE1 and KIAA1827 BINDING SITE2, designated SEQ ID:2143 and SEQ ID:12636 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29354] Another function of GAM189 is therefore inhibition of KIAA1827 (Accession XP_290834.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1827.

[29355] KIAA1829 (Accession XP_030378.2) is another GAM189 target gene, herein designated TARGET GENE. KIAA1829 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1829, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1829 BINDING SITE, designated SEQ ID:14863, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29356] Another function of GAM189 is therefore inhibition of KIAA1829 (Accession XP_030378.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1829.

[29357] KIAA1836 (Accession XP_114087.2) is another GAM189 target gene, herein designated TARGET GENE. KIAA1836 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1836, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1836 BINDING SITE, designated SEQ ID:12627, to the

nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29358] Another function of GAM189 is therefore inhibition of KIAA1836 (Accession XP_114087.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1836.

[29359] KIAA1853 (Accession XP_045184.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA1853 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1853, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1853 BINDING SITE, designated SEQ ID:19095, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29360] Another function of GAM189 is therefore inhibition of KIAA1853 (Accession XP_045184.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1853.

[29361] KIAA1904 (Accession XP_056282.1) is another GAM189

target gene, herein designated TARGET GENE. KIAA1904 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1904, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1904 BINDING SITE, designated SEQ ID:16492, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29362] Another function of GAM189 is therefore inhibition of KIAA1904 (Accession XP_056282.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1904.

[29363] KIAA1922 (Accession XP_057040.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA1922 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1922, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1922 BINDING SITE, designated SEQ ID:7553, to the nucleotide sequence of GAM189 RNA, herein designated

GAM RNA, also designated SEQ ID:246.

[29364] Another function of GAM189 is therefore inhibition of KIAA1922 (Accession XP_057040.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1922.

[29365] KIAA1924 (Accession NP_694971.2) is another GAM189 target gene, herein designated TARGET GENE. KIAA1924 BINDING SITE1 and KIAA1924 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA1924, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1924 BINDING SITE1 and KIAA1924 BINDING SITE2, designated SEQ ID:1857 and SEQ ID:8341 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29366] Another function of GAM189 is therefore inhibition of KIAA1924 (Accession NP_694971.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1924.

[29367] KIAA1937 (Accession XP_057107.3) is another GAM189 target gene, herein designated TARGET GENE. KIAA1937 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1937, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1937 BINDING SITE, designated SEQ ID:2983, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29368] Another function of GAM189 is therefore inhibition of KIAA1937 (Accession XP_057107.3) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1937.

[29369] KIAA1971 (Accession XP_058720.4) is another GAM189 target gene, herein designated TARGET GENE. KIAA1971 BINDING SITE1 and KIAA1971 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA1971, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1971 BINDING SITE1 and

KIAA1971 BINDING SITE2, designated SEQ ID:6902 and SEQ ID:11506 respectively, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29370] Another function of GAM189 is therefore inhibition of KIAA1971 (Accession XP_058720.4) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1971.

[29371] KIAA1987 (Accession XP_113870.1) is another GAM189 target gene, herein designated TARGET GENE. KIAA1987 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1987, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1987 BINDING SITE, designated SEQ ID:7554, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29372] Another function of GAM189 is therefore inhibition of KIAA1987 (Accession XP_113870.1) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1987.

[29373] KIAA2028 (Accession XP_059415.2) is another GAM189 target gene, herein designated TARGET GENE. KIAA2028 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA2028, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA2028 BINDING SITE, designated SEQ ID:12100, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29374] Another function of GAM189 is therefore inhibition of KIAA2028 (Accession XP_059415.2) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA2028.

[29375] Kruppel-like factor 12 (KLF12, Accession NP_009180.3) is another GAM189 target gene, herein designated TARGET GENE. KLF12 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KLF12, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementar-

ity of the nucleotide sequences of KLF12 BINDING SITE, designated SEQ ID:1127, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29376] Another function of GAM189 is therefore inhibition of Kruppel-like factor 12 (KLF12, Accession NP_009180.3) . Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLF12.

[29377] Killer cell lectin-like receptor subfamily d, member 1 (KLRD1, Accession NP_002253.1) is another GAM189 target gene, herein designated TARGET GENE. KLRD1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KLRD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KLRD1 BINDING SITE, designated SEQ ID:2353, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29378] Another function of GAM189 is therefore inhibition of Killer cell lectin-like receptor subfamily d, member 1 (KLRD1, Accession NP_002253.1), a gene which is a re-

ceptor for the recognition of mhc class i hla- e molecules by nk cells and some cytotoxic t- cells. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLRD1.

[29379] The function of KLRD1 has been established by previous studies. Natural killer (NK) cells are a distinct lineage of lymphocytes that mediate cytotoxic activity and secrete cytokines upon immune stimulation. Several genes of the C- type lectin superfamily, including members of the NKG2 family, are expressed by NK cells and may be involved in the regulation of NK cell function. See NKG2A, 161555. To study CD94, an antigen preferentially expressed on NK cells, Chang et al. (1995) used an expression cloning strategy to isolate an IL2- activated polyclonal NK cell line cDNA encoding CD94. Northern blot analysis revealed that CD94 is expressed as 3 major transcripts of 0.8, 1.8, and 3.5 kb and a minor transcript of 5.5 kb in NK cell lines. The predicted protein contains a 147- amino acid extracellular domain with several motifs characteristic of C- type lectins, a 26- amino acid transmembrane domain, and a 7- amino acid cytoplasmic domain. CD94 is classified as a type II membrane protein

because it has an external C terminus. The amino acid sequence of CD94 is 27 to 32% identical to those of NKG2 family members NKG2A, NKG2C (KLRC2; 602891), NKG2D (OMIM Ref. No. 602893), and NKG2E (KLRC3; 602892). Chang et al. (1995) stated that the virtual absence of a cytoplasmic domain implies that CD94 function requires association with other receptors. Lazetic et al. (1996) demonstrated that CD94 forms disulfide- bonded heterodimers with NKG2A, NKG2C, and NKG2E. Rodriguez et al. (1998) reported that the CD94 gene contains 6 exons. Using S1 nuclease protection and primer extension assays, they found that transcription initiation in CD94 is heterogeneous, but is restricted to a 60- bp region around the major initiation site. Chang et al. (1995) mapped the CD94 gene to chromosome 12 using a somatic cell hybrid panel. By analysis of a cosmid contig, Plougastel and Trowsdale (1998) found that the CD94 gene is located at 12p13.2- p12.3, within the NK complex, a cluster of C- type lectin genes preferentially expressed in NK cells.

[29380]

[29381] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[29382] Plougastel, B.; Trowsdale, J. : Sequence analysis of a 62-kb region overlapping the human KLRC cluster of genes. Genomics 49: 193- 199, 1998. ; and

[29383] Rodriguez, A.; Carretero, M.; Glienke, J.; Bellon, T.; Ramirez, A.; Lehrach, H.; Francis, F.; Lopez- Botet, M. : Structure of the human CD94 C- type lectin gene. Immunogenetics 47: 305- 309.

[29384] Further studies establishing the function and utilities of KLRD1 are found in John Hopkins OMIM database record ID 602894, and in cited publications listed in Table 5, which are hereby incorporated by reference.Killer cell lectin-like receptor subfamily d, member 1 (KLRD1, Accession NP_031360.1) is another GAM189 target gene, herein designated TARGET GENE. KLRD1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KLRD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KLRD1 BINDING SITE, designated SEQ ID:2353, to the nucleotide sequence of GAM189 RNA, herein designated GAM RNA, also designated SEQ ID:246.

[29385] Another function of GAM189 is therefore inhibition of Killer cell lectin-like receptor subfamily d, member 1 (KLRD1, Accession NP_031360.1), a gene which is a receptor for the recognition of mhc class i hla- e molecules by nk cells and some cytotoxic t- cells. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLRD1.

[29386] The function of KLRD1 has been established by previous studies. Natural killer (NK) cells are a distinct lineage of lymphocytes that mediate cytotoxic activity and secrete cytokines upon immune stimulation. Several genes of the C- type lectin superfamily, including members of the NKG2 family, are expressed by NK cells and may be involved in the regulation of NK cell function. See NKG2A, 161555. To study CD94, an antigen preferentially expressed on NK cells, Chang et al. (1995) used an expression cloning strategy to isolate an IL2- activated polyclonal NK cell line cDNA encoding CD94. Northern blot analysis revealed that CD94 is expressed as 3 major transcripts of 0.8, 1.8, and 3.5 kb and a minor transcript of 5.5 kb in NK cell lines.
